CCFA regularly publishes leaflets on various automobile-related subjects: press surveys, trend charts, etc.

All these publications can be consulted on our website

www.ccfa.fr

In 2009, French car manufacturers coped with the crisis; government supports (loans, scrap incentives, temporary part time contracts) were very pertinent and efficient. However, in France, for them, a country of large production and supply, the problem of competitiveness hinders development. Fast and furious efforts must be made in this area.

Dear reader,

In 2009, the historic crisis that began in 2008 has continued to affect the world's economy gravely. For the automotive sector in traditional manufacturing countries, the difficulties continue despite the brutal shock having passed. After global automotive production dropped by 4% in 2008, it fell by a further 13% in 2009 to just under 62 million vehicles representing 11.5 million fewer units than in 2007. These variations were already important on an annual rate; they mask the infra-annual variations and illustrate the brutality of adjustments that affect our sector. They also hide a contrast between zones enjoying geographic growth, China in particular, and the traditional manufacturing regions that are in free fall. In the United States, automotive manufacturing has dropped by nearly 50% compared to 2007. Fortunately, the reaction from French manufacturers and the implementation of government policies to support the economy with finely targeted and calibrated measures limited the impact of the crisis.

From mid-2009, domestic vitality in most developing countries resulted in a return to growth in auto production in these areas. The contrast profoundly accelerated global production development, which swung geographically towards developing countries; they represented 46% of global production in 2009 compared to 16% in 2000.

In this difficult context, French automotive manufacturers focused on gaining market share in Europe and developing in emerging regions. In Western Europe, they took 22.4% (+0.8 point) of the passenger car market and 38.2% (+3.7 points) of that of light commercial vehicles. Outside EU-17, the market was affected by the crisis but nevertheless represented 35% of opportunities. The fall in global production was limited to 8%, and their share of global production grew from 8.2% to 8.7% in 2009.

In France as in other major car manufacturing countries, the size of the sector (both upstream with equipment, goods and services and downstream in the networks) meant the fall in business had serious consequences. From the beginning of the crisis, the French government quickly supported the industry's efforts; direct loans, the launch of scrap incentive schemes (nearly 600,000 vehicles involved at end 2009) and measures associated with temporary part time contracts encouraged controlled management of falling figures. On the industrial side, the Automotive Branch Platform (PFA), set up in 2009 by French manufacturers represented by CCFA, and their suppliers joined to form the CLIFA (Automotive Suppliers' Liaison Committee) and produced its initial results with four key priorities: lean manufacturing, tomorrow's expertise and businesses, better information and communication management and, finally, a mid- and long-term strategy in terms of products and international development.

The perspectives for the French auto industry's growth depend on factors shared by the industry as a whole, and on more specific elements.

In 2009, the government organized the Industry Conventions which inventoried the competitive nature of the French industry compared to others in the eurozone. They highlighted the heavy load of employee social contributions, the changing payroll costs since 2000 and taxation related to production. These factors represent major obstacles to French automakers' competitiveness as there are many production sites in France mainly supplied by French suppliers who are also penalized by this unfriendly environment. Furthermore, the intense competition on the European market, the first market opportunity for French manufacturers, further aggravates the branch as shown by the severe slump in operating margin (operating cash flow/value added) for the car industry measured by Insee; it has shrunk from 40% in the early 2000s to 7% in 2008. For CCFA and also for the *Groupeement des Fédérations Industrielles* (GFI) and the MEDEF, the question of competitiveness is capital and a priority.

Xavier Fels
Chairman of CCFA

For the factors more specific to the automotive industry, research and development spending which is huge (over the last few years, the industry has been the leading sector in terms of research and development investments and patents filed in France) has been maintained despite the crisis. Government measures to support innovation such as the research tax credit and the consolidation of automotive competitiveness clusters represent efficient levers for the future of our industry. Part of great national borrowing is for future transportation and therefore automobiles, and should complement this virtuous strategy.

For the French market, results for 2009 vary with a 10% rise in passenger car sales thanks to efficient support measures and, on the other hand, extreme drops for commercial vehicles (-19% for light commercial vehicles and -38% for heavy trucks). For the first half 2010, the success of passenger car sales (+5%) still owes a lot to the scrap incentive scheme; light commercial vehicles are enjoying an upturn (+11%) whilst heavy trucks are still suffering (-24%). For the entire year, the effects of decreasing scrap incentive and "bonus/malus" schemes must be watched carefully. The change in average CO₂ emissions for new registered cars in France in 2009 remains very positive with 133 g compared to 149 g in 2007. The share of small vehicles is very high; car purchases in household spending represent less than 3%, compared to 4.1% in 1990.

The new car market in Western Europe was supported in several countries by the scrap incentive scheme and remained relatively stable in 2009. In 2010, the end of these schemes may heavily affect the market, which should register a fall. The market for light commercial vehicles dropped 28% in 2009 after falling 11% the previous year. Finally, the heavy truck market collapsed (-41%). As with France, the commercial vehicle situation is starting to turn around but levels are still low, particularly for heavy trucks.

In Eastern Europe, many markets where French manufacturers are present collapsed, leading to a fall in opportunities outside Western Europe after several years of healthy growth. In Africa and South America, French manufacturers consolidated their results whilst they continued to develop in Asia. These economically booming regions with less car ownership and a demand for original equipment represent a market of large potential. The development and consolidation of industrial sites are still strategic objectives.

2009 was also marked by varied changes in how cars are used, illustrated by a development in global sales. On the one hand, passenger car registrations remained almost stable and, on the other, commercial vehicles (all tonnage combined) dropped by 15%. In France, households have continued to travel whilst companies, struck by a drop in business, have reduced the use of their commercial vehicles.

The crisis does not call into question the regular improvement of road haulage eco-efficiency; trucks and commercial vehicles emit increasingly less CO₂ ever year in global volumes and especially per kilometer covered. CCFA and its members work hard to ensure that environmental tax discussions will not result in too high taxation on fuel (particularly diesel), already high in France compared to the European average, which would thwart the virtuous energy-saving and emission-reducing movement.

CCFA is of course at the heart of the automotive industry. At a national level, along with other professional associations (CNPA for distribution and repair, FIEV for equipment manufacturers and CSIAM for imported makes), it is constantly involved in collective discussions and major projects affecting the automotive industry as a whole. With support from its members, it acts within the major organizations throughout the business world like MEDEF, UIMM and GFI, as well as in more specialized organizations such as URF or GERPISA. Internationally, it defends French interests in ACEA and OICA, and contributes actively to the analytical capabilities and statistical data produced by these organizations.

I hope that as you read this new edition of "Analysis and Statistics", you will become aware of the quality of our work, dedicated as it is to provide a better understanding of the automotive market in France and around the world. Please contact us and visit our website (www.ccfa.fr) for further information.

Best regards
Xavier Fels
Chairman of CCFA

The French Automobile Manufacturers' Association

The Comité des Constructeurs Français d'Automobiles (CCFA) is the French automobile manufacturers' trade association. Its members are: Alpine, PSA – Automobiles Citroën – Automobiles Peugeot – Panhard, Renault,

Renault Trucks. Its mission is to study and defend the business and industrial interests (excluding labor issues which are the remit of the UIMM) of all French automobile manufacturers at both the national and international levels.

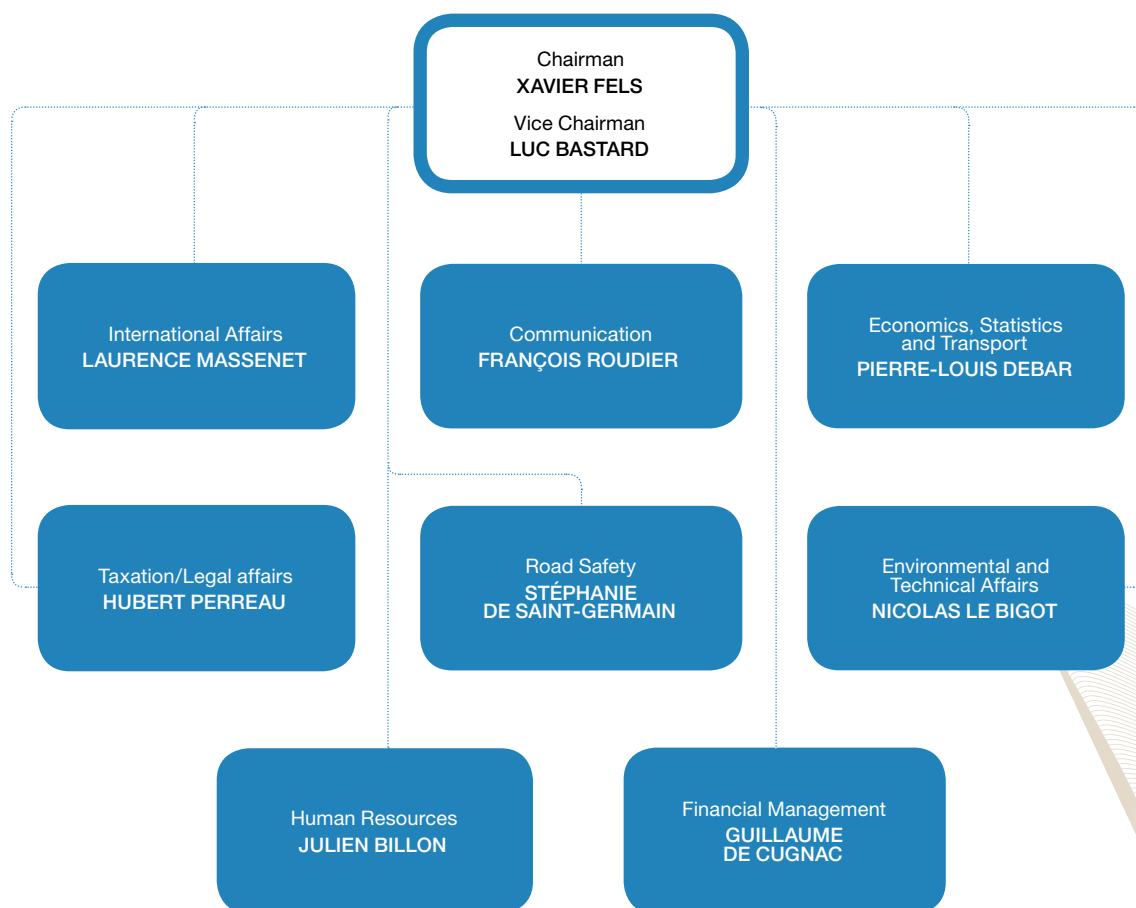

CCFA's activities encompass information, analysis and communication for its members as well as for government agencies, public officials, the automotive and road industry, the media and the general public.

Other sectors of the automotive industry (parts and equipment manufacturers, dealers, body manufacturers) have their own trade associations (FIEV, CNPA, FFC, *Fédération des Industries Électriques, Électroniques et de Communication* – Electrical, Electronic and Communications Industry Federation, *Fédération des Industries Mécaniques* – Mechanical Industry Federation, *Fondeurs de France* – French Foundries Association, *Groupe Plasturgie Automobile* – Automotive Plastics Group, *Syndicat National du Caoutchouc et des Polymères* – National Union of Polymers and Rubber Industries, etc.).

Foreign manufacturers are represented by their own association (CSIAM).

CCFA is associated with Brussels-based ACEA, the European Automobile Manufacturers' Association.

It is also a member of OICA, the International Organization of Motor Vehicle Manufacturers, which brings together national associations representing the industry from around the world.

1909

The year in which
the *Chambre Syndicale
des Constructeurs
d'Automobiles* was
founded in France

2009: the financial and economic crisis has seriously affected French car manufacturers

The financial and economic crisis put an end to the long period of growth that French manufacturers enjoyed between 1997 and 2007, marked by a 53% increase in national production representing an extra 2.1 million vehicles.

Since then, this production has dropped by 13% to 5.4 million with an 8% reduction in 2009 alone during which stocks continued to fall.

After significantly growing by 1.6 million vehicles between 1997 and 2008 (especially from 2002), opportunities for French manufacturers outside Eastern Europe were strongly affected by the crisis, falling by 350,000 units to 1.9 million. These areas, where the level of vehicle ownership is generally much lower than in Western Europe, represent markets of large potential within which investments, at this uncertain financial time, must be consolidated.

The market in Western Europe, a mature automobile zone, rose by 280,000 units over the same period. In France, the improvement was demonstrated by 385,000 Dacia vehicles, but numbers weakened elsewhere in Europe despite the increased market penetration, in a context of developing competition from overseas and a selective sales policy.

In a difficult context in 2010, French manufacturers continued to invest in France in research and development and also plants, and saw many models reviewed and revisited (Peugeot 508, Renault Master and Citroën C4).

KEY DATA

The financial and economic crisis ended several years of strong world GDP growth at nearly 5%. After a 3% increase in 2008, GDP suffered an historic drop of 1% in 2009.

Similarly to previous years, the change was very inconsistent between members of the OECD where GDP dropped by 3% and developing countries (+3%), boosted by China and India. However, for developing countries excluding China and India, growth was less sustained in Asia and the Middle East (+1%); it stopped in South America; significant decreases were been observed in Eastern Europe, particularly Russia.

Having reached a peak in the first half of 2008 and after dropping in the second, the prices of raw materials rose again returning to 2007 levels. These developments helped sustain consumer purchasing power in the short term but households were still suffering the effects of this crisis, such as the important rise in unemployment that affected their confidence. For businesses, the drop in investments hit many sectors.

In this context of a collapse of Western Europe's base market in terms of the levels observed prior to the recession, French automobile manufacturers were dealing with consumer decisions about what to buy, the rising cost of raw materials for manufacturing processes, dearer money worsened by the crisis and maintaining the euro at a high level in terms of the other main currencies. Despite everything, they had to continue to meet society's demands, which require considerable research and development expenditure. Furthermore, this crisis highlighted the entire automobile branch upstream through suppliers and downstream with transportation and the sale/maintenance of vehicles.

In this harsh economic and financial environment, the world's automobile market dropped 4% in 2009 to 66 million vehicles. In Western Europe, new car markets remained stable thanks to the different government plans for scrap incentives whilst the commercial vehicle market collapsed. French manufacturers

managed to raise their penetration in a context of increased competition and a selective sales policy whilst continuing to reduce their stocks.

In Eastern Europe, automobile growth was halted by the crisis. However, to satisfy vehicle ownership requirements, French manufacturers continued to develop commercially and industrially in this area whose opportunities should eventually grow. PSA Peugeot Citroën has recently inaugurated a factory in Russia with Mitsubishi and Renault is developing a strategic partnership with the Russian manufacturer AvtoVAZ.

In 2009, China became the leading automobile market in the world and is behind the growth of sales in Asia and, to a lesser extent, India and South Korea (support measures for the Korean market have been implemented). It is the only zone outside Europe where French manufacturers managed to improve sales in 2009. Furthermore, continuing investments (PSA Peugeot Citroën has a new partnership with Changan in China, Renault in India) should support future growth.

In Latin America in a falling market, French manufacturer sales dropped after many years of growth. New investments have been voted by the French companies to attempt to return to automobile development in this region.

Finally, French manufacturers have successfully consolidated their sales in Africa on markets greatly affected by the crisis.

+33%
Increase in world
production by French
automotive manufacturers
since 1997.

World motor vehicle production

In 2009, world vehicle production dropped by 13% to 61.7 million vehicles.

It had already dropped by 4% in 2008 after many years of sustained growth (+15 million vehicles between 2000 and 2007). The economic and financial crisis was the cause of a sudden end to growth in developed countries. It was illustrated by important drops in production in NAFTA (-32% after -16% in 2008), Western Europe (-19% after -9%) and to a lesser extent in South Korea (-8% after -7%). Japan resisted well in 2008 (-0.3%) but suffered a 31% drop in 2009. In developing regions and countries that represent the current expansion zone for the industry, growth remained, rising in 2009 to 9%. The market did however slow down compared to 2007 when growth peaked at 20%.

In 2009, production of passenger vehicles dropped by 10%. Production of commercial vehicles was greatly affected by the crisis and fell by 22%. This contrast was reflected in Europe (respectively -17% and -47%) and, to a lesser extent, in the Americas (respectively -24% and -28%) and Asia-Pacific (respectively +2% and -3%).

By country and including all vehicles, production slowed in all Western European countries: from -14% in Germany to -52% in Austria, with -18% in Italy and -20% in France.

In the Americas, production fell significantly in all countries except Brazil where there was only a slight drop (-1%).

In Asia-Pacific which now represents over half the world's production, development of Chinese (+48%), Indian (+13%) and Iranian (+10%) production continued. Production in Indonesia (-23%) and in Malaysia (-8%) fell after strong growth in 2008.

9 million

Drop in the number of vehicles produced in 2009 compared to 2008

World motor vehicle production

Between 2000 and 2009, the world's production of vehicles (61.7 million) grew by 3.4 million units representing nearly 6% growth compared to 26% in 2007, a record production level. It settled at a level close to that of 2003. In developed regions and countries, production fell by 16 million vehicles to 32 million (-32%); around 70% of this reduction was observed in 2009. These regions represent only 53% of the world's production, representing 30 points less than in 2000. Within these regions, production in North America fell by half (-9 million), in Western Europe by nearly 5 million and in Japan by over 2 million whilst it grew in South Korea (+400,000, i.e. +13%) as this country enjoyed privileged exchange rate developments. In developing regions and countries, production grew by 19 million vehicles, relying on the following five zones: China (+11.7 million) which represented 22% of the world's production in 2009, compared to 4% in 2000, Turkey and Central and Eastern Europe (+1.7 million and an 8% share compared to 5%), Indonesia, Iran, Malaysia and Thailand (+2.1 million and a 5% share compared to 2%), South America (+1.7 million and a 6% share compared to 4%) and India (+1.8 million and a 4% share compared to 1%). Overall, the market share of these emerging countries or regions rose from 16% to 46% in this period.

EMERGING REGIONS AND COUNTRIES

EVOLUTION OF MARKETS FOR FRENCH MANUFACTURERS OUTSIDE OF EU-17: ALL VEHICLES

Source: CCFA.

46%

Market share of emerging regions and countries in world motor vehicle production in 2009

In this context of changing world production, French manufacturers substantially increased exports to these regions. They grew by nearly 1 million units between 2000 and 2009, excluding EU-17 countries, to reach 1.9 million vehicles. Exports also increased by nearly 30,000 units in Turkey and countries in Central and Eastern Europe, by over 90,000 vehicles in Africa, by 180,000 in Latin America including Mexico and by 675,000 in Asia. Exports grew significantly in 2008 particularly to Turkey and countries in Central and Eastern Europe (+340,000) and Latin America including Mexico (+300,000).

World rankings of automobile manufacturers

French manufacturers relied on their base market in Europe with the help of demand support schemes and on their presence in healthy developing regions. This helped them reduce the crisis's impact. PSA Peugeot Citroën is ranked sixth in the world with a production of 3 million vehicles, a drop of 8.5%. Renault continued to develop synergies through its alliance with Nissan and built nearly 2.3 million vehicles (–5%) and is still ranked eleventh. Production by French manufacturers represented 8.7% of world production, representing less than the highest level reached in 2001 with 9.8% but more than 7.3% in 1997.

In the crisis, world production fell by 13%. Production varies depending on the geographical area and only Asia-Pacific grew slightly. Since 2006, the Toyota group (–22%) have held the first ranking in front of General Motors (–22%). The Volkswagen group (–5%) consolidated its third place taken in 2007 from Ford (–15%), whose production no longer includes Jaguar or Land Rover.

Amongst the Asian manufacturers, Hyundai-Kia, whose production grew by 11%, maintained its ranking of fifth. However, Honda (–24%), Nissan (–19%) and Suzuki-Maruti (–9%) all dropped one position. European manufacturers all suffered from negative growth. Daimler (–33%) and BMW (–13%) were more affected by the crisis than generalists PSA Peugeot Citroën (–8.5%), Renault (–5%) and Fiat (–3%).

8.7%
Market share of French manufacturers in world automobile production in 2009

World automotive markets

After putting an end in 2008 to a great many years of growth in new vehicle registrations, the financial and economic crisis led to a second year of a weakened world market. It dropped by 4% to 66 million units, 5 million units less than in 2007 but 6 more than 2003. China, whose access to vehicle ownership is continuously developing in line with the progressing lifestyle, saw its market (supported by government measures) increase exponentially to 13.7 million vehicles (+50%, +4.6 million vehicles). The Chinese market is now the world's leading automobile market. Outside China, registrations dropped by over 12%, or 7 million fewer vehicles. After slowed growth in 2008, developing regions witnessed contrasting situations. In South America and Asia excluding the three major countries (China, Japan and South Korea), markets were stable even if the drop in commercial vehicle investment was as evident here as it was elsewhere. Central and Eastern Europe, however, suffered a market collapse (-43%). In key industrialized countries where vehicle ownership has reached maturity, falling markets continued except in countries that had schemes that helped lessen the fall. Within NAFTA (United States, Canada and Mexico), sales fell by 21%, compared to 4% in Western Europe where several passenger car markets were supported and sustained. Finally, the falling trend on the Japanese market continued (-9%) to a level that had not been reached since the end of the 1970s.

In the United States, the financial crisis called a halt to household consumption and the market continued to fall to 10.6 million vehicles compared to over 17 million between 2004 and 2006.

In Western Europe, the market fell for the second consecutive year. The passenger car market remained stable supported by the different scrap incentive schemes, but the commercial vehicle market collapsed by 30%. All vehicles included, the variations between the different countries were very disparate, from -63% in Ireland to +18% in Germany, with -21% in Spain, -11% in the UK, -3% in Italy and +4% in France.

In Central and Eastern Europe, falls of over 50% were observed, particularly in the Ukraine and Russia. Stimulated by a scrap incentive scheme, the Turkish market grew by 9%.

In Japan, sales returned to a level similar to those of the end of the 1970s at 4.6 million vehicles (-9%) with the fall lessened by a scrap incentive scheme. Sales in South Korea were supported by the same kind of incentive and grew by 19% to nearly 1.5 million vehicles, to reach the same level as in the early 2000s.

In Asia-Pacific and excluding the three major countries (China,

Japan and South Korea), sales fell by 1.5% because of the drop in commercial vehicles (-13%). Growth continued at over 10% in India and Iran but sales fell by 2% in Malaysia and collapsed in Indonesia (-20%).

In South America, automobile sales continued and the markets dropped only slightly (-3%), still with the dichotomy between passenger and commercial vehicles. Sales collapsed in Argentina (-20%) but increased in Brazil (+11%).

In Africa, where much lower volumes are involved, the markets were affected by the crisis (-22%); the fall observed in South Africa was clearly greater than the reductions posted in North Africa and Egypt.

21%
China's share of
world sales in 2009

Trends in production and trade among the three leading world automotive regions

In 2009, the European Union (27 countries) remained the world's leading production zone.

The world crisis particularly affected its exports whilst the domestic market for passenger cars was supported by different government incentive schemes to encourage consumption. In North America including Mexico, production essential for the local market continued to suffer the consequences of falling business. Imports which had long been developed to satisfy this large market fell less, as in 2008, than local production, strongly affected by the situation of the three majors. Japan saw its exports shrink by 46%; the share of these exports in production returned to 46% (58% in 2008), reaching the level observed in the early 2000s. Imports still only account for less than 5% of total car registrations. Beyond these three historical poles, China, which became the second largest producing country in 2009, essentially only produced to satisfy its domestic market; imports, like exports, represented less than 5% of production.

46%

Percentage of vehicles manufactured for export in Japan in 2009

Trends in the three leading global automotive markets have contrasted sharply since 1990.

In the European Union (currently 27 countries) growth in vehicle production was 6% (compared to 38% in 2007) and trade, already important, appears up by nearly 40% despite the drops of the last two years.

In North America, including Mexico, since 2009 production has fallen by 25%. Imports, already very high in 1990 and which have continued to grow) resisted better, as in 2008, than local

production. Exports only represented 5% of production (17% for the EU and 46% for Japan).

Finally, in Japan vehicle production dropped by 40% because of the slower domestic market and the fall in exports observed in 2009. Previously after suffering a decade of falling figures until 2001 (-29% compared to 1990), the domestic market and exports grew in association with the depreciation of the yen. In 2008, they exceeded the levels of 1990 by 15% before falling to 38% of the same levels in 2009.

World trade in automotive products

According to World Trade Organization, worldwide trade in automotive products continued to grow in 2008, a year that marked the beginning of the financial crisis: +3% to \$1,234 billion. This trade accounted for 8% of world goods exports and 12% of world manufactured product exports. Trade dropped drastically within and towards certain developed regions but the annual increase continued in development areas. In dollars, the various intra-regional trade in automotive products reached 760 billion (-1.5%), representing 62% of world trade of these same products. In NAFTA and Europe (excluding CIS), this share exceeded 70%. It reached 65% for South America and just over 20% for Asia-Pacific. Trade outside regions reached around \$470 billion (+10%), up in particular for CIS, South America, the Middle East, Africa and China. Contrary to previous years, Europe (excluding CIS) was the main contributor to this increase just in front of Asia. China, whose trade was fairly balanced in 2008, imported for \$29 billion of which 44% came from the EU-27, 36% from Japan and 11% from NAFTA.

WORLD TRADE IN AUTOMOTIVE PRODUCTS

(1) Since 2005, exports to North America mainly target the United States, Canada and Mexico.

(2) For comparison, 15 EU countries have been included since 1993, 25 since 2004 and 27 since 2006.

(3) Since 2001, CCFA has based its estimates of imports and exports for European Union countries on local customs statistics.

(4) The "other countries" total regroups countries not included in the three major divisions.

Source: GATT/WTO.

Between 2007 and 2008, the dollar depreciated over 6% in relation to the euro and 13% in relation to the yen, while it gained 18% in relation to the Korean won. In 2008, Germany was still the largest exporter of automotive products with an 18% share worth \$223 billion. In the world's second largest market, Japan exported \$171 billion worth of vehicles, 35% of this to North America, creating a trade surplus of \$155 billion.

The United States is still the world's leading importer of automotive products at \$200 billion; in line with the recession, the deficit in automotive products was reduced to \$88 billion. EU-27 automotive exports amounted to \$655 billion. Trade within the EU accounted for over 70% of this total. France accounted for more than 5% of world exports worth \$68 billion.

62%
Share of intraregional trade in world automotive industry products

New passenger car registrations by country

With 13.7 million new cars registered in Western Europe, the market grew slightly compared with 2008 (+0.5%).

For the second consecutive year, it has over 14 million units, representing one fifteenth of the European car fleet. This almost stagnant situation is the result of contrasting changes for countries the most often associated with the scrap incentive schemes to encourage demand. As in 2008, the infra-annual variations were significant yet on a par with lower levels; the market fell by around 9% in the first half then grew by 14% in the second. Scrap incentive schemes strongly supported the German and French markets. The first, up by 23% achieved its highest level since 1999 thanks to the €2,500 scrap incentive. This resulted in the purchase of a million more passenger cars than originally forecast. In France, the scrap incentive scheme also enabled 10% growth in sales (with the "bonus/malus" system); the French market exceptionally became the second European market in front of Italy and the United Kingdom. For different reasons (synchronization with effects of the crisis, allocated monies, etc.), the different schemes were not always as efficient in the other major European markets. In Italy, the market was practically stable. In the United Kingdom, the drop in volume reached 137,000 units (-6%). The Spanish market collapsed by -18% representing a loss of 210,000 units. For markets that had little or no government aid, the drop was very strong compared to 2007.

NEW PASSENGER CAR REGISTRATIONS IN EUROPE

The European market covers 17 countries (the 15 European Union countries plus Switzerland and Norway). These countries have similar environments and comparable economic conditions. Since 1990, this market has included the former East Germany. In 2006, light commercial vehicles were reclassified as passenger cars in Spain: the variations at comparable scope compared to 2005 were -1.9% in Spain and +0.9% in Western Europe. Lower oil prices and the expansion of the European Union drove strong growth in the automotive market between 1986 and 1989.

Then followed a period of high-level stability. Demand plummeted in 1993, leading to a 16% drop in registrations. This market constantly grew and from 1998 to 2007, registrations regularly exceeded 14 million units in more or less favorable economic climates. For the last four months of 2008, the market reflected the global crisis. So over the whole of 2008, it dropped 8% before a slight upturn in 2009 (+0.5%) thanks to the success of the scrap incentive scheme in many countries.

+0.5%

Increase in new passenger car registrations in Western Europe in 2009

New passenger car registrations by group

After three years of dropping figures with a stable market in 2008, 2009 was marked by a 22% upturn in penetration for French groups on the European market. The launch of new models allowed French manufacturers to maintain their presence after this falling trend, due in particular to the intense competition and the weak yen. Six major 'generalist' European automakers manufacturing a full line of vehicles each held more than 8% of the market.

GROUP MARKET SHARES⁽¹⁾ IN EUROPE

(1) Based on the 2008 scope of consolidation.
See page 61 for group definitions.

1 out of 5
new passenger cars sold
in Western Europe
is manufactured by
a French group

The Volkswagen Group, with its four main makes, has maintained its position since 1999, and now accounts for more than 20% of the market.

The penetration of French groups (22.4% for them both) stopped dropping in 2008 and grew in 2009. It reached a level close to that in 1997, after exceeding 25% between 2001 and 2003. Since 2000, Ford's market share now without Jaguar and Land Rover is around 10%; it includes Volvo (1.4%), which was purchased in 2010 by the Chinese manufacturer Geely. For the second consecutive year, Ford are ahead of General Motors who have dropped by 0.6 point to 8.9%; in 2010 GM sold Saab (0.2%). General Motors includes Opel and Chevrolet whose market share is respectively 7.4% and 1.2%. In the mid-1990s, the penetration of these two American groups was over 13% each. The Fiat Group improved its market share for the fourth year running and its penetration reached 8.8%; it was nearly 12% in 1997 and

15% in 1989. In 2009, the Italian manufacturer purchased 20% of Chrysler representing 0.4% of the European market.

The scrap incentive schemes stimulated the markets for passenger and small cars. The German groups Daimler and BMW, specialists in premium ranges and corporate sales, were more affected by the recession.

After consolidating its positions from 1997 to 2008 through diversifying its range of vehicles, Daimler lost 0.8 point market share compared to 2008, at 4.9%. BMW, including Mini, grew from 1999 to 2008; its penetration peaked at 5.9% before also dropping 0.8 point in 2009 to 5.1%.

The penetration of Toyota (including Daihatsu) was growing continuously from 1995 to 2007 but dropped for the second consecutive year to reach 5.2%, a fall of 0.3 point. Group Hyundai-Kia's penetration rose after three years in the doldrums. Its market share grew by 0.7 point at 3.8%

Range analysis in 2009

In 2007, a new range-based segmentation of the market was introduced, with the aim of eliminating the previous "others" range. Light vans such as the Citroën Berlingo have been reclassified in the low range, while other vehicles based on commercial vehicles such as the Renault Trafic have been reallocated. Four-wheel drive vehicles are now classified inside all ranges, from low to mid to high (Peugeot 3008).

| Groups | Makes | Economy and low range | Low-mid range | High-mid range | Premium range |

46 and 86
Respective numbers of models and body styles offered by French manufacturers

Breakdown and ranking by model

Of the 10 most sold models in Europe in 2009, four are made by Renault, Peugeot or Citroën, whereas in 1997, these makes were only represented by two models.

In a European market enjoying slight growth in 2009, the attractive offering of low-range cars from French manufacturers helped improve their market share.

Source: CCFA.

In Europe, 75% of new passenger cars are in the low and low-mid range. Tax breaks for more eco-friendly cars, scrap incentive schemes and the wide scope of cars available have oriented the market towards the low range, whose share has increased by an exceptional 6 points in 2009.

In the ten years from 1990 to the start of the 2000s, buyers tended to trade down from the high-mid range to the low-mid range, which offers more MPVs. The market share of sedans, although still dominant, has declined in recent years in favor of estates, MPVs, convertibles, light vans and four-wheel drives.

From 2006 to 2008, this stabilized because of an increase in the number of sedans in the low range. In 2009, the dynamic vitality of the low range, relatively poorer in MPVs, station wagons, coupés, etc. was reflected by a strong increase in the sedans which rose 5 points to 6.1%.

Each European country retained its own features until 2008 when Southern Europe continued to prefer low- and low-mid range vehicles, while premium cars and station wagons remained the most popular choice in Northern Europe. But in 2009, the success of the low range and sedans, particularly in Germany and the United Kingdom, reduced the contrast between the different regions.

Increase in the European market share for low-range models between 2007 and 2009

Technical characteristics of new passenger cars

The proportion of new diesel-powered cars in Europe as a percentage of total registrations grew significantly between 1997 and 2007. The percentage of cars with diesel engines was only 22% in 1997, and reached 53% ten years later. After a relatively stable 2008, in 2009 it dropped by nearly 7 points compared to the previous year. On this market of 6.3 million units, the share of French manufacturers was 27% in 2009 (25% in 2008, 23% in 2007 and 29% in 2000) representing about 1.7 million new diesel cars. In terms of passenger cars, diesel vehicle ownership continued to grow reaching 34% in 2009, up by 2 points for the seventh consecutive year.

TECHNICAL CHARACTERISTICS OF NEW PASSENGER CARS IN EUROPE FOR 2009

| | Average cylinder capacity | Average horsepower | 4WD % | Diesel % |
|------------------------------------|---------------------------|--------------------|------------|-------------|
| Germany | 1,664 | 86 | 7.8 | 30.7 |
| Austria | 1,645 | 81 | 12.7 | 46.0 |
| Belgium | 1,672 | 80 | 6.2 | 75.3 |

DIESEL MARKET SHARE BY COUNTRY

EUROPEAN DIESEL PASSENGER CAR MARKET

In Europe, cylinder capacity and average horsepower of car engines are very different from country to country. They depend mostly on the economic, tax and geographical conditions of each domestic market. Since 2008, the slow and regular upward trend towards the highest horsepower has stopped in parallel with the increasing penetration of low range cars. Cylinder capacity

-7 points
Reduction in the market share for new diesel-powered passenger cars in the total 2009 market

stopped increasing in 2006 as a result of downsizing (identical engine power with less cylinder capacity). The four-wheel drive share has dropped again reaching 7.8% of the entire European market representing a million units. The *per capita* rate of ownership varies widely from one country to the next depending on national market characteristics. This market share is very high in Switzerland, Norway and Austria, where mountainous terrain has fuelled sales of these vehicles. The market share of diesel vehicles in Europe is largely dependent on local regulations and tax rules. In Europe, in a market that had grown slightly in 2009, diesel car market share had lost nearly 7 points, at 46%. In Belgium, Spain Luxembourg, Portugal, France and Norway, over two out of three new registered passenger cars are diesel. In Germany and Italy, the diesel share has fallen and respectively reached 31% (-13 points) and 42% (-9 points). Traditionally unfavorable to diesel, Scandinavian countries have sharply increased their purchase of diesel vehicles, a development mainly attributable to changes in tax regulations. This trend stopped in 2009, except in Sweden where diesel car sales increased a further 5 points in 2009 to 41%. Denmark dropped 1 point however, at 45% and Finland over 3 points at 46%. In Norway, the market is almost stable at 72%.

Passenger car fleet in Europe

In Western Europe as in France, the growth of passenger cars in use slowed at the end of the 1990s and is now at around 1% a year.

In new European countries and in Turkey where vehicle ownership is at a lower level, the need for mobility is reflected in more sustained growth (5 to 7%); demand at the lowest cost is partly satisfied by imports of used vehicles.

Sales of diesel cars in Western Europe developed considerably over the last few years and diesel ownership has increased to reach 34% in 2009.

Since 2000, the percentage of cars over ten years old has remained stable in Western Europe at between 32 and 34%; the large drop in new car registrations in 2008 resulted in a strong increase in this share. The new car market in Western Europe has become a replacement market.

At 1 January 2010, the effects of the scrap incentive scheme were contrasting: a sustained increase in Germany within a huge framework, similar growth in France and a reduction to numbers in the United Kingdom.

PASSENGER CAR FLEET, AT 1 JANUARY FOR EACH YEAR

IN EU-17: EU-15, SWITZERLAND AND NORWAY

(1) The change for 2008 was calculated on a like-for-like basis.

DIESEL CAR OWNERSHIP IN EU-17

IN THE 12 NEW EU MEMBER COUNTRIES AND TURKEY

National sources: statistics organizations, Transport and Interior Ministries, professional sources.
Bulgarian and Romanian data has been revised since 2007.

SHARE OF CARS OVER 10 YEARS OLD IN EU-17

At 1 January 2009, passenger cars in Western Europe (EU-15, Switzerland and Norway) reached 206 million units. In a financial and economic recession, growth continued to weaken (1% in 2009) nearing that of the population. Increases were particularly weak (below 0.5%) in Germany, the United Kingdom, France and Sweden.

The share of diesel cars has been growing by 2 points a year since 2002 and reached 34% at 1 January 2009. In four countries, this diesel car ownership has become the majority: Austria, Belgium, France and Luxembourg. However, it is nearer 25% in Germany and the United Kingdom.

In the new EU member countries and Turkey, growth for this fleet of cars is now nearer 5-6%; in 2009 it was almost 8%. Rates as high as 10% have been observed in Poland, a country which represents over a third of this car ownership, as well as in Bulgaria and Romania. On the other hand, growth was lower in the Czech Republic (3-4%) and Slovenia (2-3%), both of which are countries with a higher car density, a higher standard of living and a local automotive industry.

34%

Share of diesel in the Western European passenger car fleet in 2009

New light commercial vehicles in Europe

The European market for light commercial vehicles dropped by 28% in 2009 after falling 11% in 2008. It has 1.3 million vehicles compared to 2.1 in 2007, representing 750,000 fewer vehicles. Sales of French vehicles dropped by 20% to 507,000 units representing 38% of the market (+3.7 points). Renovation and the extension of their offer to the small van sector in 2008 (Citroën Berlingo and Nemo, Peugeot Partner and Bipper and Renault Kangoo) have enabled French manufacturers to gain significant market shares, particularly in Belgium (+3.6 points), Spain (+1.8 points) and Germany (+1.2 points).

LIGHT COMMERCIAL VEHICLE REGISTRATIONS IN EUROPE (17 COUNTRIES)

FRENCH MARKET SHARE

(1) There was a change of scope in Spain in 2006: see notes on page 61.

MARKET SHARE OF LIGHT COMMERCIAL VEHICLES IN LIGHT VEHICLE REGISTRATIONS IN 2009 (PASSENGER CARS AND LIGHT COMMERCIAL VEHICLES)

FRENCH MANUFACTURERS' MARKET SHARE IN THE MAIN EUROPEAN COUNTRIES

Light commercial vehicles are defined as vehicles whose gross weight rating is less than 5 tons. They come in various categories: commercial vehicles derived from passenger cars, light vans, light trucks, large vans, pick-up and four-wheel drive vehicles. Since tax conditions are not the same in all European countries, the share of light commercial vehicles in total light vehicles ranges from 4% in Germany to nearly 20% in Portugal and Norway. Globally, it stood at 9% in 2009 compared to over 12% in 2007.

For many years, sales of these vehicles have been stimulated by model renewals and the fact that they offer an appropriate response to business transport and mobility needs. In 2009, the recession was still hitting this market hard and it had dropped to a level observed in 1996. In Spain and Belgium, market share for French manufacturers exceed 45% in 2009. In Germany and Italy, countries with their own, national manufacturers, French manufacturer market share stood respectively at 19% and 23%, up since 2000.

+5 points

Increase in French manufacturers' share in light commercial vehicle sales in Western Europe between 2007 and 2009

Heavy truck market and production in Europe

The European market for heavy trucks over 5 tons fell by 41% in 2009, standing at 207,000 units, a drop of 145,000 units. After four years of growth between 2003 and 2007 and a record ceiling between 2007 and 2008, in 2009 the market returned to a level close to that of 1993, a dark year for heavy trucks.

European production shrank by 64% to 203,000 units, reflecting the seriousness of the recession in 2009, after five years of great stability on the domestic market and continuous development of heavy truck exports outside the EU-15, particularly to Eastern Europe and Asia. Compared to 2003, it had dropped by 47% to a level slightly below that of 1993.

RENAULT TRUCKS' MARKET SHARE IN THE MAIN EUROPEAN COUNTRIES

-64%

Decrease of new heavy trucks production in Western Europe in 2009 compared to 2008 (record level)

In Europe, after feeling the effects of the recession between 2001 and 2003, in 2008, the heavy truck market reached a record level for the third consecutive year with an increase of 18% compared to 2003, thanks in part to the upturn in spending and in world trade that began in the second half of 2003.

However, it suffered under the impact of the financial crisis in 2009 and leveled out 30% below its 2003 figures.

Heavy truck investment cycles are relatively long; the high points of 2000, 2006 to 2008 represent 75% more than the lowest point of 1993 or 150,000 more vehicles. In 2009, the market was only 3% higher than 1993.

Demand continued to focus on the 16t-and-over segment, which accounted for 74% of total registrations, including both trucks and road tractors.

Within this climate, Renault Truck registrations dropped sharply in 2009 and its penetration stabilized at 10%, slightly below 2007.

International development of Renault Trucks was affected and its penetration in Europe (outside France) was 5% compared to 6% in 2008.

French automobile manufacturers in the new EU member countries

Since 1 May 2004 and 1 January 2007, 12 new countries have joined the European Union whose centre of gravity has now moved eastwards. New markets, such as those of the Community of Independent States and the Balkans, now seem closer. French manufacturers have had a commercial presence in this region for a number of years, developing local production plants: PSA Peugeot Citroën in Slovakia, Russia and, in partnership with Toyota, the Czech Republic; Renault in Slovenia, Romania, through the acquisition of Dacia, and Russia (plant and partnership with AvtoVAZ).

These industrial plants will enable the two manufacturers to meet demand in these countries, which is set to grow given the low vehicle densities (number of vehicles per 1,000 inhabitants) compared with France or Germany.

In 2009, vehicle production dropped sharply (–8% to 3 million vehicles) compared to the record levels achieved in 2008.

THE MARKET AND VEHICLE PRODUCTION IN THE MAIN CENTRAL AND EASTERN EUROPEAN COUNTRIES

FRENCH MANUFACTURERS' MARKET SHARE: NEW LIGHT VEHICLES

NEW LIGHT VEHICLE REGISTRATIONS (UP TO 5 TONS GVWR)

FRENCH MANUFACTURERS' MARKET SHARE: NEW HEAVY TRUCKS

Although the EU-15 is dominated by replacement demand, this is not the case in new and future member states and neighboring countries, where the potential for first-time car ownership is significantly higher. Central and Eastern European countries (CEEC) produced 3 million vehicles in 2009. Their activity slowed less than in Western Europe because of the local manufacture of small cars in phase with the current West European trends.

In 2009 because of the recession this production was higher than the domestic demand of the area, this being the sum of new vehicle registrations plus imports of used vehicles. In 2009, new vehicle sales fell by 33%. The results are different for each country. Hungary, Romania and the Baltic States are most affected by the recession.

22%

Share of new light vehicles from French manufacturers in the main new EU countries

The automotive industry in the European Union

In 2007, 2.3 million people worked in the automotive industry in the EU-27

in companies with more than 20 employees.

Value added per employee ranged from €33,000 a year in the six main new member states (up 13% compared to 2006) to more than €86,000 in Germany. In France, it was €69,000, near the European average.

Personnel costs per employee ranged from €13,000 in the six main new member states to €64,000 in Germany. In France, they reached €52,000, above the European average (€47,000).

VALUE ADDED PER EMPLOYEE

PERSONNEL COSTS PER EMPLOYEE

The automotive industry is a key sector of the European economy, encompassing:

- automotive manufacturing;
- body and trailer manufacturing;
- automotive equipment manufacturing.

The data in the above table come from surveys of national companies and have been adjusted for consistency by Eurostat. Due to difficulties in collecting and standardizing statistics at both the national and European level, only data up to 2007 were available.

In 2007, the European automotive industry employed 2.3 million people, half of them in vehicle manufacturing. Together, Germany and France accounted for more than half of the employees in the industry, with 38% and 11% respectively. At 19%, the people

employed in the new six new member countries (Hungary, Poland, Czech Republic, Romania, Slovakia and Slovenia) grew again by 2 points.

The automotive industry differed significantly from country to country in terms of structure and wages. In Germany, Belgium, France and Sweden, around 60% of automotive industry staff were employed in vehicle construction whilst this share was around 35% in the 6 new member countries.

It was between 41% and 47% in Italy, Spain and the United Kingdom.

Personnel costs per person employed varied between 13,000 in the six new member countries and €64,000 in Germany, a ratio of 1 to 5.

PSA Peugeot Citroën: www.psa.fr

In 2009, in a world crisis and when part of the base market was supported by demand incentive schemes, PSA Peugeot Citroën sales dropped by 2.2%, slower than the global market. The group's European penetration grew in a weakened market; outlets outside of this zone were maintained with good results in China and exports of spare parts. Business outside Europe represented 33.1% of total sales and PSA Peugeot Citroën remains the second European group (passenger cars and light commercial vehicles). It is the world's largest manufacturer of diesel engines.

Highly complementary Peugeot and Citroën products, models in line with demand, a policy of building cost-reducing platforms and an industrial productivity improvement program have helped the group weather the storm against a background of stiff competition in the European market, rising raw material prices and negative exchange rates (sterling).

The Group's commitment to globalization is based mainly on long-term, targeted cooperation initiatives with other automobile manufacturers. In 2006, an agreement was signed with Dongfeng Motor (second largest assembly plant in China, operating since end 2009). In 2009, PSA Peugeot Citroën cooperated further with Mitsubishi on electrical vehicles. In 2010, the two manufacturers inaugurated a vehicle assembly plant in Kalouga. More recently, a cooperation contract was signed with China Changan Automobile Group, one of its objectives being the construction of an assembly plant in China. PSA Peugeot Citroën is accelerating adaptation of its models to suit non-European consumers as part of its strategy to become a global market player.

Furthermore, the group has continued to conduct research aimed at reducing fuel consumption in vehicles. A new family of small three cylinder gasoline engines will also be developed and industrialized in France by 2012, with the objective of vehicles emitting less than 100 g of CO₂/km. The second generation of Stop&Start called e-HDi will progressively be installed in the Group's ranges as of end 2010. Finally, the first cars fitted with HYbrid4 technology will be on the market in 2011.

The group's Performance Plan for 2010-2012 based on dynamic sales and cost reduction, the launch of new models and the revision of part of the range should enable it to weather the still difficult economic climate. This strategy is supported by many commitments in terms of sustainable development (eco-design, safety and mobility, etc.)

Renault: www.renault.com

Even though it is softened by governmental schemes and support, the crisis affecting the automotive markets impacted Renault's results. In a weakened market with intense competition and continuing selective sales policies, results were up by 1.5% in Europe. Outside Europe, they dropped by 10.9% representing nearly 34% of sales.

Cooperation launched in 1999 with Nissan was further strengthened within the Alliance. New synergies have also been set up. They concern plants (the first factory manufacturing for the world was inaugurated in Chennai, India early 2010) and also purchasing, logistics, engineering, advanced research and studies. Moreover, Renault and Nissan electric vehicles will be equipped with jointly developed batteries. Many projects have

been launched for developing zero emission general public vehicles; the first agreement protocol has been signed in Israel, others are following around the world, from the United States (Tennessee) to Japan, Germany and China. In 2009, the first stone of the Tangiers plant (Morocco) was laid. In 2010, the group also strengthened its alliance strategy by signing an agreement with Daimler AG. The cooperation concerns the development of small cars including electric, gas and diesel cars and also light commercial vehicles. The strategic partnership with AvtoVAZ, now involving Nissan, will accelerate the growth of this manufacturer and strengthen Renault's and Nissan's presence in Russia. Renault is continuing its ambitions in terms of quality (products and services) and profitability (cost control) whilst focusing on the industry's social challenges (sustainable mobility, safety for all, etc.).

The development of the Logan program and the end of the renovation of the Mégane family (Scénic produced in France) ensure Renault has one of the youngest ranges in Europe, which should allow it to weather the uncertain times ahead.

Renault Trucks: www.renault-trucks.com

Renault Trucks employ 14,000 people all over the world. In France, the manufacturer employs 10,000 people, of which 1,300 work in research and development. Beyond industrial cooperation, synergies within the AB Volvo group between the 4 brands (Renault, Volvo, Mack and UD Trucks—formerly Nissan diesel) have generated significant savings, particularly in purchasing.

2009 was marked by a drastic fall in the heavy truck market. In Europe, it reached levels similar to 1993, a dark year for this sector. In this context, Renault Trucks' penetration remained above 10% within the EU and was consolidated on the French market and also in Eastern Europe. The crisis did not spare the international market; however, Asia and North Africa were less affected. In this last region, Algeria and Tunisia remained the key markets for Renault Trucks, outside of Europe and Turkey. Starting in 2009, Renault Trucks will be able to use two new sites outside Western Europe: the first in Turkey following an agreement signed in 2007 with Karsan for the assembly of several thousand vehicles per year and the second in Russia, after the opening of a Volvo plant.

The product offering is led by the current Euro V standards of October 2009 and Euro VI for end 2012 as well as the launch of solutions that aim to reduce heavy truck fuel consumption.

World production of French automobile manufacturers

Between 2004 and 2008, world production by French manufacturers oscillated around 6 million vehicles.

In 2008 and 2009 respectively, it fell by 6.1% and 7.7% because of the global recession. However, since 1996, production had grown by 42% representing annual growth of 3% thanks, initially, to the increase of opportunities in Europe outside France and then, to opportunities outside Europe. Passenger car production fell by 1.9% to 4.8 million units in 2009 but production of light commercial vehicles (-37.1%, at 533,000 units) and heavy trucks (-65.2%, at 21,000 units) which had grown in 2008 was more heavily affected by the recession.

PRODUCTION/ASSEMBLY SITES AND CUMULATED PRODUCTION PER MODEL

| Group/Make | Model | Launch | Production or assembly sites in 2009 | Production (in units) Total at end 2009 |

In 1996, French automobile manufacturers changed the way they reported output. They began reporting the number of vehicles assembled at the roll out location. The concept of KD and CKD units has been abandoned. This production takes into account

the Renault Trafic II, assembled by GM Europe in the United Kingdom and by Nissan in Spain. In addition, the scopes of consolidation have changed (see notes on page 66).

Markets for new French vehicles

In 2009 for the second consecutive year and in contrary to the previous years, the national markets for French manufacturers (+5.5%) grew more than sales outside France (-10%) which were more affected by the world crisis. In France, the strong presence of French manufacturers in sectors benefitting from market support (scrap incentive scheme) or eco-improvement support ("bonus/malus" system) allowed them to increase sales in a difficult environment. Foreign markets represented about three-quarters of opportunities for French manufacturers compared to two-thirds between 1999 and 2001 and less than 60% in 1990.

From 1997 to 2001, registrations of French vehicles in France followed a rising trend. An offer that was rich in new models, efficient and financially advantageous allowed them to gain market share above 1997 figures. The cycle reversed in the period 2002-2007. Increased competition and, subsequently, a selective sales strategy implemented by French manufacturers had not allowed them to consolidate these gains. In 2008, the rise in volumes sold can be explained by the dynamic commercial vehicle market and the offer from French manufacturers that was rich in models with low CO₂ emissions in-line with the

"bonus/malus" system. In 2009, this eco-scheme associated with the scrap incentive program supported general car sales and particularly those in French groups adapted to the offer. Since 2006, French car exports have included the Renault Trafic II and from 2007 those of Renault Samsung Motors. French passenger car exports reached 3.5 million units, a fall of 5%. Commercial vehicles were severely affected by the crisis with a 37% decline and nearly 350,000 units for the light commercial vehicle market and 70% with 12,000 units for heavy trucks.

Competitive factors in the French automotive industry

In an aggressively competitive global market, French automobile manufacturers must be competitive, able to handle industry-wide factors such as labor costs and the strong euro and also problems that are the bane of the automotive sector like the opening of the base market to competition, the difficulty of passing the rise in raw material costs on to the end customer, and more.

Industry conventions have shown that compared to other eurozone countries the change in hourly labor rates since 2000 and the particularly high social contributions in France weigh heavily.

12 points

The difference between France and Germany for hourly labor costs in manufacturing between 2000 and 2008, to France's disadvantage

Competitiveness is defined as an industry's ability to withstand competition and expand in markets. It is relative, in that it is determined in comparison with the other market operators. To continue to grow, the French car industry must guarantee performance comparable to that of its European, American, Japanese, Korean and in the future, Chinese, even Indian competitors. Beyond the problems of globalised competition and industry (payroll, social and fiscal costs), there are competitive factors specific to the French automotive industry, resulting from the properties of vehicles and the automobile industry as a whole. One of the factors affecting the French industry is the hourly labor costs. In France, the cost of labor including social contributions is one of the highest in the European Union including the eurozone. It is higher than the United Kingdom, Italy, Spain, etc. and much higher than costs in Eastern Europe. And labor costs affect the entire industry, particularly via the supply chain. Furthermore, the exchange rate can significantly alter trade terms because of the increasingly large share of production outside of the eurozone.

Furthermore, the prices of raw materials in euro have risen substantially since 2001. Passing these price hikes on to consumers is extremely difficult in an environment of aggressive competition and declining purchasing power of households affected by significant price increases in a range of areas: food, energy, housing, etc. For several years, all of these factors have weighed heavily on the French automotive industry's margins (ratio of operating cash flow to value added); according to Insee (the French National Institute for Statistics and Economic Studies), they have fallen from 40% in the early 2000s to 7% in 2008.

RAW MATERIAL PRICES IN EURO

Since early 2002, the euro's rise has affected French exports, forcing companies to bolster their sales and production initiatives in order to continue to expand their markets outside the eurozone. On the other hand, there are factors associated with opening up the market, whether internal or external. In general, domestic opportunities (known as the "base market") represent a solid foundation for nourishing growth on international markets through development and innovation. The French automotive industry's base market is its domestic and especially European market where there is open competition and where non-European manufacturers have a significant and steadily growing share. In other auto-making countries, market access is more difficult and local manufacturers therefore have a broader base market from which to develop internationally.

The prices of raw materials in euro have increased hugely since early 2001, despite the fall in the second half 2008 followed by a rebound. Since 2010, rubber price increased by 243%, reaching a record level; oil price has climbed by 119% and steel price by 42%.

It is difficult to pass price hikes on to consumers in the current climate of stiff competition. This is particularly the case in so-called developed countries in light of the multiple choices made by households in terms of consumption, which have only been aggravated by the economic and financial crisis. Finally, for the freight sector that buys light commercial vehicles and heavy trucks, the current gloomy context weighs on demand and prices.

The automotive industry and the crisis

A vehicle needs liquidity in the short and long-term associated with the different stages in its life: from design to sale, throughout the various production stages.

As a durable good for households and an investment for businesses, world sales of automobiles, particularly in OECD countries, have been harshly hit by the financial crisis that began in 2008, which was closely followed by an economic crisis. These considerable drops in sales have similar effects on the entire automotive sector in the broad sense.

The operating margin of the automotive sector, measured by Insee, dropped to low levels observed in the early 1980s during the second oil crisis, making it more difficult to attract capital investment and conduct research.

The various government measures (nearly 600,000 scrap incentive bonuses in France, training support, temporary part time contracts, etc.) helped control the crisis, supporting a sector of the industry characterized by brutal and extensive fluctuations.

Halved

Difference in the production of light vehicles in France by French manufacturers from before to during the crisis

The economic and financial crisis has dramatic effect on the automotive sector, upstream starting with the suppliers and downstream as far as vehicle sales/maintenance, including freight transport, manufacturers of equipment or services for companies, including research and development. Liquidity is required at the various stages mentioned.

From the physical process of manufacturing the vehicle until the point of sale, many financing instruments, including loans between companies, are already used. During the sale, households and companies often use loans to finance this durable good. Capital-intensive by nature, the automotive industry requires considerable physical investments (production sites, etc.), which are paid off over long periods.

During their design and before they are sold, vehicles require research phases lasting several years, in a process of permanent progress, in order to be able to meet the needs of society in terms of safety as well as the environment (reducing greenhouse gas emissions, etc.). Research is currently being conducted for applications in the longer term.

The falling market share of French manufacturers in the European base market starting in 2004, following the considerable increase

observed between 1997 and 2003, as well as the difficulties in passing on rising raw material prices to consumers and the collapse of the European market in 2008 can explain the fall in operating margins of the automotive industry measured by Insee, which have now reached that of the early 1980s, the era of the oil crisis.

It is important to remember that operating cash flow (OCF) and financing are the main sources of liquidity for future capital expenditure.

The support measures set up by many European countries (France, Germany, etc.) helped stabilize in 2009 the new car market in Western Europe. In France, nearly 600,000 scrap incentive bonuses were paid by the Ministry of Recovery, and a progressive end to the scheme is in place until the end of 2010. Other government measures such as training or temporary part time contracts have encouraged management of this crisis by keeping jobs in a context where production of French commercial vehicles in France has been cut in half, between the average level of 2007 and the lowest point in 2009.

Economic ratios of the automotive industry in France

The automotive industry uses a wide variety of technologies, requiring significant investment that has accounted for over 16% of all industrial capital expenditure since the beginning of the 2000s. However, this share fell to 9% in 2008, as the Western world's market for new vehicles stagnated and subsequently plummeted.

To address new social and environmental demands, the automotive industry is investing more in intangibles and R&D (see over the next few pages) for which automotive competitiveness clusters are particularly appropriate.

9%

Share of automotive industry employees in the manufacturing and energy sector in 2008 in France

Every year, the **SESSI**, formerly the **service statistique du secrétariat d'État** (Department for Industrial Studies and Statistics) and now attached to **Insee**, produced annual surveys providing one of the main sources of information about the French industry.

A significant overhaul of these surveys is currently in progress, which explains why this data is not available after 2007. The future data will be available through a new business nomenclature. The automotive industry covers motor vehicle manufacturing; motor vehicle, caravan and recreational vehicle body manufacturing; and the upstream manufacturing of automotive equipment. However, the statistics do not encompass all automotive industry suppliers. Products such as seats, tires and glass are classified under other categories (see also page 53).

Automotive manufacturing

After rising strongly between 1996 and 2004 (+30%), in line with growth in vehicle production, value added (excluding VAT) per employee in constant euro declined for several reasons: costs associated with new environmental standards, a stagnating and then contracting market for new cars in Western Europe aggravated by the recession, and the rising cost of raw materials. In 2009 it reached the lowest point of 1993. The automotive manufacturing industry dedicated 2% of sales to capital expenditure, representing nearly €2 billion, to develop new models and optimize its production capacity. These figures do not include research and development costs (see the next page). Export sales have constantly increased, today oscillating around 60% compared with 38% in 1990.

Research and development spending in the automotive sector

In 2007, the French automotive industry was not the leader of all other industries in France in terms of corporate spending on research and development (R&D), as it has been since 1999.

The automotive industry's R&D budgets followed that of the pharmaceutical industry and exceeded those of the aviation and space industry. Its expenditure stood at €4.6 billion, representing 15% of all corporate R&D costs.

After rising strongly between 1998 and 2005 (+70%), R&D expenditure in the automotive industry reached a ceiling of around €4.5 billion. In 2007, this represented 27% of gross value added in the sector. The automobile leverages a wide variety of technologies and therefore requires significant research initiatives to ensure its reliability throughout its lifetime, guarantee user safety and protect the environment.

TOTAL CORPORATE RESEARCH AND DEVELOPMENT EXPENDITURE IN FRANCE IN 2007 IN THE MAIN RESEARCH SEGMENTS

AUTOMOTIVE INDUSTRY SPENDING ON RESEARCH AND DEVELOPMENT

The research-related statistics office of the French Ministry of Education carries out surveys on research and development (R&D) spending by companies and in the wider public sphere.

The total R&D budget is broken down into domestic spending (DRDS), which covers work performed in France, regardless of the origin of funding, and external spending (ERDS), corresponding to work performed by other companies or public research organizations. A portion of the latter work may be performed outside of France.

From 1999 to 2006, the leading R&D segment in France was the automotive industry; it was the second largest in 2007. It stimulates other industries such as plastics and electronics. In 2007, 20% of domestic R&D spending in the automobile industry was performed by subsidiaries in which foreign companies had a controlling interest (over 50%).

In 2007, 31,000 equivalent full-time employees (including 14,600 researchers) worked in automotive R&D. These figures were up 41% compared to 1998 (+127% for researchers). According to the French National Industrial Property Institute (INPI), the groups PSA Peugeot Citroën Automobiles (including Faurecia) and Renault respectively filed the first and second largest number of patents with INPI in 2009. France has three major equipment manufacturers in the top twenty.

Automotive competitiveness clusters in France

Set up by the government and local authorities in 2005, these competitiveness clusters bring together companies (small and mid-sized), research units and training centers to work on collaborative projects.

They also provide many services: business intelligence, assistance for filing patents, networking, etc. Their role is to boost the competitive nature of the French economy by highlighting its capacity for innovation and encouraging the structure and proximity of the different regions.

In 2009, the automotive industry continued to conduct its research and development efforts through clusters, where it works to meet the challenges of industrial excellence and durable mobility. This transverse action brings together automakers, equipment manufacturers, innovative small and mid-sized companies, research laboratories and educational organizations including universities. In 2008, 383 companies were involved in automotive competitiveness clusters.

AUTOMOTIVE COMPETITIVENESS CLUSTERS IN FRANCE IN 2008⁽¹⁾

(1) Information concerning cluster members in 2008 are taken from 2007 data.
Sources: DGCIS survey, Insee, DIACI, competitiveness clusters.

The internationally oriented Mov'eo cluster (www.pole-moveo.org) covers the Ile-de-France, Basse-Normandie and Haute-Normandie regions. Mov'eo has the main aim of federating projects dealing with the optimization of mobility, the development of synergy between individual and collective modes and performance improvement: consumption, the environment, road safety, mobility and services, mechatronics. Two new business fields were created in 2009 for energy storage systems and also demo and carbon-free vehicles, taking the number of themes explored by the cluster to 7. The extent of its geographical scope offers this cluster a broad range of opportunities for increasing catchment areas and creating new business.

The Mobilité et Transports Avancés cluster (www.pole-mta.com), based in Poitou-Charentes, benefits from considerable experience with alternative propulsion modes: hybrid and electric vehicles, biofuel, onboard energy. Experimentation, development, production and use of electric vehicles are its flagship activity.

Since early 2009, the Mov'eo and MTA clusters are enjoying a rapprochement thanks to the complementary nature of their respective activities. MTA will become a technical and testing center specializing in "clean mobility" and its members will join Mov'eo.

The Véhicule du Futur cluster (www.vehiculedefutur.com) draws on the traditional catchment areas of the automotive industry, Alsace and Franche-Comté, with growing interaction with Germany and Switzerland. The cluster aims to anticipate industrial activity, technological orientation and customer expectations for coming years around several focal points: reducing engine consumption and emissions, improving passenger compartments, developing new vehicle types, traffic management tools, design and production systems, material and process research, industrial excellence in the service of companies. In 2009, a program steered by this cluster to improve the competitive edge of small and mid-sized companies in the automotive industry was applied to all of France.

The goal of the Lyon Urban Truck & Bus cluster (www.lutb.fr) is to meet the challenges offered by the growing need for mobility of persons and goods within towns. It coordinates structuring activities for the region: manufacturers, transport operators, research centers. The business of the LUTB cluster focuses on optimizing the energetic sector (diesel engine, hybridization, gas, biofuels, etc.) for heavy vehicles (trucks and buses), security, safety (users of public transport, truck drivers,

freight, hazardous materials, etc.), architecture and comfort, telematic systems (ITS) and modeling of movement. At the end of 2009, a demonstrator project for a freight system in an urban environment coordinating all the cluster's research programs was launched.

Set up in western France (Brittany, Pays de La Loire, Poitou-Charentes), the iDforCAR cluster (www.id4car.org) aims to achieve excellence in the automotive industry, involving small and mid-sized companies, by developing know-how in small series and specific vehicles, a field with stiff competition on the international stage. The cluster is also involved with processes and products: on-board systems (assisted driving, communication interfaces, reliability), research in architecture and materials used (weight, solidity, recyclability), control of engineering and industrial processes for small series, perceived quality, in particular sensorial, of the finished vehicle, and environmentally friendly vehicle design.

127

Number of labelled projects from automotive clusters in 2008

French automotive foreign trade

2009 was a crisis year marked by an unprecedented contraction of world trade. Exports of French automotive products fell by 26% to €35 billion. The automotive industry remains one of the leading export sectors alongside aeronautical, agro-food, etc. In 2008, 4 companies in this sector are ranked in the leading nine exporting companies. The industry's trade deficit continues to worsen (–€4.7 billion) affected in particular by the French market's healthy demand for small cars produced in countries with much lower cost structures and the drop in demand for premium cars in Europe, reducing opportunities for French manufacturers' domestic plants.

The positive balance for parts and engines remained relatively stable at €3.9 billion, mainly due to the momentum of French manufacturers' production sites outside France with French supplies, for example for thruster units.

In 2009, the automotive industry's share of all goods exports (imports) stood at 10%. In 1997, a crisis year for the French new vehicle market, it stood at 12% and 9% respectively.

The trade balance for passenger cars improved significantly between 1996 and 2004, from a deficit of €350 million in 1996 to healthy surpluses of more than €7 billion.

Since 2005, a decrease in production in France and rising imports following the large-scale opening of the French markets to foreign manufacturers were reflected in a sharp decline in the surplus, which became a deficit in 2007. The world crisis worsened the deficit in 2008 and 2009.

The trade balance deficit for commercial vehicles dropped to €0.7 billion in this crisis context. Exports of light commercial vehicles and heavy trucks respectively fell by 42.6% to €1.4 billion and 51.1% to €1.8 billion.

Flows of parts and engines also slowed: –25.7% for imports and –21.0% for exports. The surplus remained relatively stable at €3.9 billion.

EXPORT RANKINGS – YEAR 2008

10%

Share of automotive products in French goods exports in 2009

French automotive foreign trade

The deficit of industrial automobile trade (excluding used vehicles) worsened in 2009, at –€4.4 billion (–3.2 in 2008). It is broken down into a deficit of €5.6 billion with the EU-27 and a surplus of €1.2 billion with the rest of the world (respectively –6.1 and –2.9 in 2008). The deficit is mainly due to the result posted with the EU-27, which can be attributed to the crisis in the automotive markets and stiff competition.

The positive balance with the rest of the world is down to €1.2 billion. The crisis affected EU exports but many countries show a significant trade surplus: Algeria (€770 million), Iran (€590 million), Switzerland (€460 million) and Brazil (€290 million).

Sources: customs data processed by CCFA.

After exceeding 4 billion between 1997 and 2005, the trade surplus with the EU-15 gave way to a deficit of €1.2 billion in 2007. This extended in 2008 to –€5 billion and reduced to €3.1 billion in 2009. Between 2008 and 2009, the improved deficit can be explained by improved trade with Italy (€0.2 billion to €0.8 billion) and by a smaller deficit with Spain (–€2.9 billion to –€1.6 billion) and Germany (–€8.1 billion to –€6.1 billion), after the launch of the scrap incentive scheme in these countries to support the market. With the 12 new EU member countries, the heavy truck deficit was €2.5 billion in 2009 (–€1 billion in 2008), because of

the rise in local operators and a collapse of the local markets. Outside the EU-27, the heavy truck deficit stood at €1.2 billion. Trade with Latin America and Africa remains encouraging. The deficit with Japan and South Korea combined was relatively stable at –€1.9 billion.

€1.2 billion

Surplus of industrial automobile trade between France and the EU-27 for 2009

Diesel passenger cars

Since 2002 in France, there have been more diesel passenger car registrations than registrations of vehicles running on other fuels, accounting for 71% of the total in 2009, a drop of 7 points compared to 2008 due do the growth of low range vehicles on the French market. 56% of cars in use on 1 January 2010 had diesel engines. In 2009, 1.8 million diesel cars were produced by French manufacturers representing a 25% drop compared to the record level of 2004. The share of diesel cars in total production has fallen since 2008 (41%) and 2004 (47%).

In 2009, France was the world leader in diesel car ownership with 1,628,000 new passenger diesel engine cars, ahead of Germany with 1.2 million units. The new, quieter, more efficient diesel engines are still enjoying popular acclaim. In Europe, diesel's market share has dropped by over 6 points to 46% representing 6.3 million units. Because of the recession, diesel car production and exports have fallen by 21%.

7 out of 10

new passenger cars registered in France are diesel-powered

New passenger car registrations by model, range and body style

In a competitive market, French manufacturers regularly refresh their offer (new models and restylings) whilst extending their ranges. They still keep old models and offer new versions (short and long MPVs, station wagons, convertibles, coupés, crossovers), focusing on multipurpose applications; they can thus satisfy the increasingly diverse demand. Environmental performance and enhanced active and passive safety are features on the increase in this massive production of new models.

For 2010, the strong presence of French groups in the low range boosted by the “bonus/malus” and scrap incentive schemes, the healthy revision of existing models (Citroën C4 and C4 Picasso, Mégane CC) and the launch of new models (Peugeot RCZ and Renault Wind) should help them deal with challenges from the strong competition.

Used passenger cars

In 2009 as in previous years, registrations of used passenger cars exceeded 5 million units to reach 5,240,000.

The used car market is generally affected less by the recession than the new car market but in 2009, the government measures (scrap incentive and "bonus/malus" schemes) supported the new car market more and the used car market dropped by 3%.

Every year, two or three used cars are purchased for every new car. 18% of cars in the total population change hands every year. 60% of cars owned or used by households were bought used, versus 51% in 1991.

USED/NEW CAR RATIO

USED/TOTAL CAR RATIO

Passenger cars are durable goods that consumers purchase, use, maintain and eventually sell on the second-hand market. Used cars are purchased and sold through dealers or directly between consumers. Those less than five years old are usually sold through dealers, who represent approximately half of the total market.

Somewhere between 4 and 6 million used cars are exchanged every year. This market is subject to less fluctuation than the new car market. In 2009, demand for new cars rose by 10.7% to 2.3 million units whilst demand for used cars dropped by 2.8% to 5.2 million units. The new/used ratio fell to 2.3 (i.e. -0.3 point). The demand for used vehicles is generally similar to

the growth rate of the entire population, and is less sensitive to economic factors than demand for new cars. It is still affected by measures to stimulate the new car market ("bonus/malus" system, government scrap incentive, etc.). Transactions involving vehicles more than five years old rose due to the aging of the passenger car fleet and to increasing multi-car ownership in France. This share rose from 48% in 1990 to 62% in 2009.

Used cars that are less than one year old can be considered new. In fact, they are often registered by automotive dealers as demonstration or leased vehicles and then sold on the retail market. They represented 384,000 registrations or 17% of the new car market, a drop of 5 points compared to the previous year due to the effect of the scrap incentive on the price of new vehicles. Since 2001, registrations of used cars less than one year old have declined steadily as a percentage of total registrations, only accounting for 7% in 2009, versus 12% in 2001.

Average ownership of a car by a French household

New vehicle registrations in French overseas departments (DOM)

The annual markets for new vehicles are a more recent phenomenon in France's overseas departments and have accounted for 60,000 to 75,000 vehicle registrations since 1998. The four French overseas departments are Guadeloupe, French Guiana, Martinique and Reunion Island.

The ratio of registrations for heavy trucks over 5 tons was exceptionally larger in 2009 in the DOM (1.7%) than in mainland France (1.6%) because of the collapsing market on the mainland. However, the share of light commercial vehicles is still greater (16.5% compared to 14.2%). In 2009, the number of registrations of new light vehicles dropped by 8% compared with the previous year. The DOM market weakened whilst the French mainland grew by 6%. The scrap incentive also supported passenger car sales but the recession and, more specifically in the French Indies, the social climate of early 2009 weighed heavily on the market. French manufacturers suffer from intense competition in passenger cars; their market share has been below 50% since 2006. However, they are faring better on the light commercial vehicle market.

Households car ownership

In 2009, multi-car households accounted for 36% of the total compared with 26% in 1990 and 16% in 1980. Car ownership is very high among households in rural and semi-rural areas (rural areas located close to towns) at nearly 93%. 64% of households in the Paris region own at least one vehicle (60% in 2000).

CAR OWNERSHIP BASED ON AREA OF RESIDENCE

The car ownership rate is the proportion of households that own at least one vehicle, expressed as a percentage.

It is closely connected to income, the age of the head of the household, the socio-professional category, the residential location and the number of people living in the house.

- 20% of the wealthiest households had a car ownership rate of over 90% in 2009; 20% of the least well-off households have at least one car, at over 60%.
- In towns with over 100,000 inhabitants, the car ownership rate has not declined; 80% of households owned vehicles in 2009, compared with 75% in 1995.
- The rate of car ownership among older households is increasing; in 2009, their rate of car ownership reached 75%, compared with 62% in 1995.
- Rural households, large households and workers typically own more vehicles.
- The non-working and employee categories have relatively lower rates, although their car ownership rates have increased considerably since 2000 (+6.2 and +5.6 points respectively).

83%
of households have
at least one car

Households vehicles in use

Daily car use has dropped regularly in recent years, with 72% of the total car fleet used in 2009 compared with 79% in 2000.

Since 2006, there are more diesel-powered (58%) than gasoline-powered cars. The average number of kilometers on the odometer continued to rise and now totals 108,000, i.e. 15,000 kilometers more than in 2000 and 38,000 kilometers more than in 1990. 78% of all cars in use belong to the low and mid-low ranges, compared with 60% in 1990.

Years after 2007 cannot be compared directly with previous years; the scope of light commercial vehicles has been enlarged.

Source: Sofres survey processed by CCFA and INRETS.

An annual Sofres survey gives a detailed picture of the cars

owned or available to households in France. Most of these vehicles are passenger cars, but light commercial vehicles account for about 5% of the total fleet. Their share continues to grow.

After rising throughout the 1990s, the average age of a vehicle tended to stabilize between 2000 and 2002 as the economic environment improved. After 2003, it started to rise again, reaching 8.2 years in 2007. The two following years it dropped slightly and stood at 8 years in 2009.

The most common taxable horsepower were in the 4 to 7 hp categories.

Cars in the low and mid-low ranges have gained value after a couple of years and their share of the total population has once again increased to the detriment of the premium ranges: in 2009 they represented respectively 47% and 31% of the population, whilst the high-mid range represented 12%.

Domestic passenger transport

Personal transport drives the economy, shaping economic and social exchanges, creating wealth, and underpinning whole sectors such as health and tourism.

When expressed as passenger-kilometers, which underrepresents urban transport and focuses on domestic transport (excluding long distance international transport), roads emerge as the dominant mode, with 82% passenger cars and 6% coaches and buses using them in 2009.

Cars and light commercial vehicles allow people to carry their belongings, offering an appropriate solution to transport today, particularly in sparsely-populated residential areas or regions where there is insufficient demand to make public transport networks economically and socially relevant solutions.

DOMESTIC PASSENGER TRANSPORT

Sources: MEEDDM/SOeS, Insee.

EVOLUTION OF DOMESTIC PASSENGER TRANSPORT

Sources: MEEDDAT/SOeS, Insee.

Personal transport is obviously linked to the economy, as is the transport of freight, but it also includes the vital social aspect of meeting people.

Whereas freight is more closely associated with industrial, agricultural and craft production, personal transport covers a much broader economic sphere.

While commuting between home and work is predominant, the developing service economy also depends on the mobility of people; this is particularly important in such personal services as health and tourism. People select their mode of transport on the basis of their starting point/destination, distance and time, as in the transport of freight.

Transporting people requires significant capital expenditure in each mode and is generally paid off over a long period during which the infrastructure is built and maintained.

When measuring transport in terms of passenger-kilometers, light vehicles tend to dominate in domestic passenger transport.

This can be expressed as the number of daily trips, particularly in dense urban areas where transport facilities and other methods (bicycles, motorcycles, etc.) play an important role, or as passenger-kilometers when dealing with international long distance travel, showing the relevance of each mode of transport; the French National Travel & Transport Survey (ENTD 2007) whose results are just being published makes it possible to update national statistics that date back to 1994.

Domestic passenger transport per person expressed in passenger-kilometers rose continuously until 2002 (a rise of 16% compared to 1990). Since then, it appears to have tailed off due to rising fuel prices, and dropped 3% between 2002 and 2009.

-3%

Decrease from 2002 to 2008 in domestic passenger transport for all modes per inhabitant in passenger-kilometers

Domestic freight transport

Transporting freight drives the economy, enabling production sites to connect with each other and with consumer sites, which in turn link to reprocessing-recycling plants. The time dimension must be added to this spatial model, often associated with town and country planning.

Each mode of transport (road, rail, inland waterways, pipeline, etc.) depends on infrastructure synonymous with the kind of large-scale capital expenditure that is generally paid off over a long period.

Road haulage meets many of the criteria involved in selecting a transport hub. According to the Road Freight Haulage Survey from the French Ministry of Transport, 58% of the French freight loads are delivered within a radius of 50 kilometers, and 49% of ton-kilometers generated by these deliveries involve distances of under 300 kilometers.

DOMESTIC FREIGHT TRANSPORT IN FRANCE

79%
Goods transported by French road carriers that travel less than 150 kilometers measured as freight tons

The demand for freight transport is closely linked to the economy of the country and its interactions with other countries; it corresponds, on the one hand, with the domestic demand of various economic players and, on the other hand, with exports of producing companies in the country.

Some countries, such as Germany and France, act as key freight transit countries due to their geographical locations. In the case of road haulage, this also leads to the phenomenon of cabotage. The physical transfer of goods exported by a country is a major focus of economic competitiveness. The destination (the source for imports) and the type of freight or good traded are often critical when choosing the appropriate mode of transport. Some liquids can be transported via pipelines, thereby avoiding any disruptions in supply; ports are used for trade with distant countries. Domestic demand from economic players (households, businesses and administrations in the broadest sense) covers a very varied range of goods and properties, and is met either by domestic production or by imports, and transport provides a physical connection among production sites and with consumer outlets, and finally between the latter and reprocessing-recycling plants. In France, this has a major impact on town and country planning.

Because of the great variety in goods, many factors influence the choice of mode of transport. Among them:

- the weight of the goods: car manufacturers mainly transport coils of steel by rail or waterways;
- delivery time: perishables such as fresh products must be transported quickly and for the most part are usually transported by road;
- departure and arrival sites, both in production (linked with town and country planning) and in consumption, which mostly means households living in built-up areas.

Different modes of transport also depend on a specific infrastructure. This entails large-scale capital expenditure, usually paid off over a long period, and careful deployment.

Intensive usage, due to massive traffic flows, makes the infrastructure issue all the more relevant, as does the use of several different modes of transport in a single logistics chain, where there will be interruptions when loads are shifted from one mode to another.

Due to its flexibility, ability to pervade the entire road network, adaptability and quality of service, road haulage addresses many of these factors, demonstrating that rather than being a single homogenous market, transport consists of a multitude of sub-markets, which often cannot replace each other. No choice of mode is available for most goods transported, particularly in the last few kilometers.

Ignoring the geographical location of the departure and arrival sites, there are two basic units for measuring the transport of goods: tons (measured during loading) and ton-kilometers.

The French Ministry of Transport's Road Freight Haulage Survey shows that nearly 60% of French freight tons move less than 50km from their source, and that nearly 49% of French ton-kilometers are generated less than 300km from the source.

Automobile traffic

Automotive traffic increased by an annual average of 2.6% between 1980 and 2001, and has remained relatively stable since 2001 (+0.1%). In 2009, a full year of the most serious financial and economic crisis since the Second World War and despite the sharp average annual drop in fuel prices, traffic rose 0.2% after a drop of 1.4% in 2008.

The year's results differ greatly depending on the type of vehicle. Passenger car traffic has been buoyant (+0.5%); increasing tourism travel in vehicles (compared to 2008 when the price of fuel had reached an all time high) compensated for the drop in vehicle commutes. Average kilometers driven remained stable (−0.1%). French freight heavy truck traffic fell by 11.6% because of the recession after a drop of 5.5% in 2008.

Average kilometers driven by a heavy truck fell to the level of the early 1990s.

(1) New work has led to an increase in the amount of road haulage (international and in transit) provided by foreign operators.

Source: National Transport Accounts MEEDDM/SOeS, Insee.

Automobile traffic is estimated by comparing vehicle counts on national, regional, local and urban roads with the average number of kilometers covered per year by the vehicles in use and fuel consumption data. It also includes data on vehicles registered abroad.

In 2009, road accounts for 87% of all domestic transport for passengers and 83% for freight.

In 2009, the number of French-registered vehicles on the road rose by 0.5%, comparable to previous years, but far lower than in the 1990s.

More light vehicles are using diesel engines, which now power 60% of this segment.

As regards traffic, diesel accounts for 73% of the traffic of light vehicles registered in France, against 54% in 2000 and 30% in 1990.

The consumption per vehicle given in the table above includes overconsumption associated with biofuels, which have a lower energy quotient than conventional fuels. Judging by the first estimates from the French Energy Observatory, deliveries of gasoline in joules fell by 3.6% compared with a drop of 3.3% in liters, while deliveries of diesel rose 1.1% compared with a 1.2% rise in liters.

−1,000km
Drop in a car's annual average kilometers travelled in France, from 2000 to 2009

Automobile traffic and CO₂ emissions

The number of French and foreign vehicles on French roads has increased by 27% since 1990, while the corresponding CO₂ emissions have risen by only 8%.

The credit for enhanced energy efficiency stems from a variety of factors. The average consumption per registered vehicle on the road was 17% between 1990 and 2009 (increased number of diesel engines, efforts made by manufacturers and drivers). Also and without considering the impact of biofuels, the quantity of CO₂ required for a heavy truck to move a ton of goods a kilometer in France dropped by over 20% between 1990 and 2009, despite the impact of the recession last year.

Contrary to the previous two years, in 2009 the increasing share of biofuels in fuel deliveries (close to annual French targets) also helped lower CO₂ net of renewable energy sources.

AVERAGE KILOMETERS COVERED IN A YEAR BY A PASSENGER CAR

Source: Traffic Statistics.

-8%
Reduction in CO₂ emissions for road traffic between 2004 and 2009 according to CITEPA

Passenger car traffic involves the number of vehicles on the road and the average number of kilometers they cover in a year. Over the long term, the increase of the fleet has slowed down and now shadows the growth of the population as a whole. The growth in multiple car ownership and the sharp rise in fuel prices are behind the drop in the average number of kilometers driven per year by passenger cars. In 2009, the first estimates from CITEPA for road transport CO₂ emissions net of renewable energy sources stand at 118 million tons.

After the stable situation observed in the early 2000s, a clear drop was observed linked to the effects of the economic recession and also to the increase of biofuels in fuel deliveries. For 2008, CO₂ emissions net of renewable energy sources for road traffic can be broken down, according to CITEPA estimations, to 55% for cars, 18% for light commercial vehicles and 27% for heavy trucks, including coaches and buses.

Passenger transport price indices

In 2009, because of the drop in fuel prices, the price index for passenger cars (purchases and use) fell by over 3%. The price index for air passengers benefited less because of an increase in price and services; it rose by 5%. The price index for rail passengers grew by 3%, faster than in previous years. The price index for the road transport of passengers (not including taxis) continued to fall (nearly -2%). Since 2003 the real price indices for the various passenger transport modes have changed in very different directions: -12% for road transport of passengers (not including taxis), +8% for passenger cars, +4% for air passengers and +6% for rail.

Source: Insee.

The price indices of the various passenger transport modes show evolutions in prices inclusive of tax. So, for air transport, this includes airport tax; in other modes, infrastructure-related costs are only shown insofar as they can be included in the retail price. Furthermore, only the part paid directly by the household is considered. For example, if a region or a local authority decides, in the context of a town or country planning strategy or social measures, to subsidize a part of transport-related expenses, this will appear as a reduction in household expenses. Fuel surcharges are included in the index for air transport of passengers.

The indices for rail and road transport of passengers only relate to intercity links.

The index for passenger cars is defined including purchasing as well as running expenses.

To calculate the actual change in the real prices of these main modes of transport, these indices have been adjusted by the consumer price index in the above graph.

After remaining near their 1995 level, the real price indices of the various modes of passenger transport fluctuated in different directions after 2003: from 2003 to 2009, the tax-adjusted personal car index (purchase and use of passenger cars)

rose 8%, and largely exceeded its 2000 level. After 4 years of increases, the index for air passengers rose again (+4%). The rail passenger index increased by 6%, continuing the growth it began in 2000, whilst road transport of passengers (not including taxis) dropped by 12%. Only the share of the price paid directly by households is factored into these calculations.

and -12%**
Respective change between 2003 and 2009 of the price indices adjusted for inflation, for passenger vehicles and haulage

Freight transport price indices

Over the last quarters, changes in freight transport price indices have been much more extreme than previously.

In 2008, road freight, traditionally moderately variable, grew by 5% compared to the previous year before dropping by 2% in 2009. Since 2000, the price index of freight transport by road rose by 2% per year on average, from 1.3% for international to almost 2.2% for intercity, with 2% for proximity freight transport by road. Over the same period, the fluvial index showed a lesser change (+1.2% per year), varying from 1.3% for domestic transport to 0.1% for international transport.

Air transport, followed by fluvial transport and, to a lesser extent, road transport, have seen considerable year-on-year variations in freight indices. The high and low points of the air transport index observed over the last year have a 13% gap (39% in 2008). The volatility of fuel prices is the cause; for river transport, the relationship between demand and supply explains the figures.

FREIGHT TRANSPORT PRICE INDICES IN FRANCE

Source: MEEDDM/SOeS.

FREIGHT TRANSPORT PRICE INDICES

Source: MEEDDM/SOeS.

+2.2%
Average annual increase since 2000 of the intercity road freight transport price index

Freight transport price indices are calculated by the statistics department of the French Transport Ministry (SOeS). For road and river transport, only activities performed on behalf of others by companies registered in France with freight as their core business are included; a company transporting its own products by its own means is therefore not counted. The indices are calculated according to representative services defined mainly by the loading and unloading locations, the type of freight transported, as well as the characteristics of the contract binding the shipper and the carrier. The data used correspond to the current prices at the end of each quarter.

Monitored since the start of 2006, indices for air freight consist of freight transport services departing France by air waybill. The transport service is defined by the unloading location and the airline in charge of transport. Unlike the data for road and fluvial transport, the indices are drawn up using the so-called unit value method. They include fuel and security surcharges paid to the airline providing the transport.

The maritime price index has also been monitored since early 2006. It includes services provided by a company registered in France with maritime freight as its core business (bulk and ferry). It is based on international price indices, unit price and tariffs.

Due to the high volatility of fuel prices, the price index for air freight has fluctuated greatly since 2006; a difference of 39% was observed between the low point, in the first quarter of 2009 and the high point, in the third quarter of 2008. Between the low point of the second quarter of 2009 and the high point of the first quarter 2010, the difference was 13%. After annual average growth of 16% between 2006 and 2008, the index dropped 23% in 2009 compared to the previous year and in the first quarter 2010, reached a level below that observed in 2006. The price index for

maritime freight is very volatile, in line with the changes in bulk prices. On annual average, after growing 31% between 2006 and 2008, it fell 44% compared to the previous year.

Available since 2000, the fluvial freight price index has risen an average of 1% per year until 2009, compared to 4% until 2008. Between 2000 and 2008, the increase was considerably lower in the domestic index (+3% per year) than in the international index (+5%). However the international index fell in 2009, so for the period 2000-2009, it only rose by 1.0% whereas the domestic index grew by 1.6%. To a lesser extent than with air transport, infra-annual variations are also found in fluvial transport, more often due to supply and demand.

The road haulage price index has increased on average by 1.9% per year since 2000 compared to 2.4% in 2008. This can be broken down as 1.3% for international and 2.2% for intercity. Compared with fluvial and air transport, infra-annual variations are of less importance even though, as shown by the structure of road haulage cost price of the CNR (see page 47), in December 2008 fuel accounted for 23% and 16% respectively of the total cost of long-distance and regional road haulage.

Household motoring costs

For all households, the smaller the district in which the household is, the more the fuel purchases increase.

For households with cars, fuel purchases comprise a lower share of overall consumption for the 20% of better-off households (3%), compared with over 4% for other households.

In light of the tax component in the price of fuel and insurance, low-income households with cars pay more taxes, proportionally to their consumption, than the 20% of wealthier households.

FUEL COST FOR HOUSEHOLDS, INCLUDING THOSE WITHOUT CARS, BY RESIDENCE AREA

Source: Insee, Family budget survey 2006.

5%

Share of fuel in the total consumption of households living in rural areas

The “Family Budget” surveys conducted every 5 years by the French National Institute for Statistics and Economic Studies (Insee) reveal the proportion of large consumer items in the household budget and provide data depending on their different characteristics: socio-professional category, age, income, residence area, etc.

There are two important differences for typical car items when compared to national figures. With respect to transport insurance costs, the full cost is factored into the surveys, while only the service (spending minus repayments) is recorded at the macro-economic level. When it comes to spending on used vehicles, the full cost is reflected in the surveys, while at the macro-economic level, this spending corresponds mainly with the margins made by professionals involved in a transaction, and does not include transactions between individuals. Some charts show the breakdown of different car items as a percentage of total consumption, equivalent to individual consumption (excluding rent) based on income, broken down by 20% segments of the population: Q5 is the fifth quintile, i.e. 20% of households with the highest earners, ahead of Q4 and then the combination of Q1 to Q3.

In 2005-2006, the vehicle budget for all households with cars amounted to just over 16% of their total consumption. New car purchases account for barely a half, ranging from 7% for the 60% of households with lower incomes to 8% for the fifth quintile. Nearly two thirds of households in Q1-Q3 buy used cars, whereas nearly two-thirds of Q5 households buy new cars. While nearly 4% of total consumption is devoted to fuel, only the richest quintile spends much less on consumption for this item. The same goes for transport insurance. As these items are taxed most heavily, it looks as if car-owning Q1-Q3 households pay more taxes than households in the richest quintile for the use of their vehicles in proportion to their consumption. By breaking down all households (car owners or not) into categories of residence location, fuel appears to play a higher role the smaller the town. This means that households in the Paris area spend 2% of their consumption on fuel whereas people in rural areas spend 5%.

Road freight cost price

According to the National Road Transport Committee (CNR), the share of professional diesel in long distance road freight rose by 7 points between 2001 and 2007 to 28%.

This share then lost nearly 5 points and settled around 23% in 2008-2009.

For the period 2001-2009, the share linked to infrastructures increased by 1.2 points to reach 6.1% in 2009.

The cost of equipment ownership (road tractors and semi-trailers) dropped by 1.9 points to 12.8%.

Between 2002 and 2009, the cost price for long distance road freight rose by 25%, an average of 3.2% a year.

For this same period, cost price for regional transport rose by 18%, an average of 2.3% per year.

ROAD FREIGHT COST PRICE STRUCTURE FOR LONG DISTANCE

ROAD FREIGHT PRODUCTION COST

ROAD FREIGHT COST PRICE STRUCTURE IN DECEMBER 2009

Source: CNR.

13%

Share of vehicle ownership in the CNR index of long-distance road freight costs

The National Road Transport Committee (CNR) publishes, among others, two indexes showing changes in the cost of professional road transport: one for long distances and the other for regional transport.

Long-distance transport covers domestic or international transport by a maxi-code articulated truck and trailer where operating restrictions make it impossible or uncertain for the driver to return home each day.

Regional transport, with vehicles carrying a total load of between 3.5 and 19 tons, refers to transport within a region and its neighboring regions, where operating conditions enable the driver to return home each day.

Between December 2001 and 2007, professional diesel, together with substantial increases in oil prices, took an increasingly large role in the production cost of long-distance road freight, rising from 20% to nearly 28% of the total price. One year later, because of the drop in oil prices from this summer, costs fell by 22% before returning to 23% in 2009.

From 2001-2009, infrastructure costs increased by 1.2 points to 6.1%. On the other hand, equipment ownership (road tractors and semi-trailers) and maintenance (upkeep and repairs) dropped

by 1.9 and 0.7 point respectively, more than the figure for driving staff (down 0.3 point). In the case of regional transport, fuel accounted for 16% of combined costs in December 2009; this lower percentage is one of the causes of the low 7-point increase in the regional index between 2002 and 2009 when compared with the long-distance index. The share for equipment ownership rose from 20 to 22% over the same period.

Automotive price indices

In 2009, the new passenger car price index rose 0.2%, or 0.1 percentage points more than inflation. Since 1995, the new car price index has decreased by 14% in real terms. In the continuing ebb and flow of oil prices after the peak of July 2008, fuel prices dropped sharply in 2009 (-17%). Nevertheless, infra-annual variations during this year showed an increase. The parts, accessories, repairs and maintenance price index grew strongly (+4.1% in 2009), reflecting among other things the higher cost of raw materials, essential technical capital expenditure and better qualified labor.

YEAR-ON-YEAR AUTOMOTIVE PRICE CHANGES

| | Consumer prices | New car prices | Prices of parts, accessories, repairs and maintenance of passenger vehicles | Fuel prices |
|------|-----------------|----------------|---|-------------|
| 2007 | 1.5% | 2.0% | 4.2% | 1.8% |
| 2008 | 2.8% | 0.6% | 5.1% | 12.2% |
| 2009 | 0.1% | 0.2% | 4.1% | -17.1% |

RETAIL PRICE OF DIESEL IN FRANCE AND THAT FOR JANUARY 1999, INDEXED FOR CONSUMER PRICES

Sources: DGEMP, Insee, CCFA calculations.

HARMONIZED PRICE INDICES FOR THE EUROZONE (13 COUNTRIES)

Source: Eurostat.

The table shows year-on-year changes in the following indices:

- consumer prices;
- new car prices;
- prices of car parts, accessories, repair and maintenance;
- fuel prices.

The new car price index compares the prices of passenger cars with similar technical characteristics, so that price rises resulting from quality and equipment improvements can be factored out. Allowance is made for periodic rebates (except by mutual agreement) as well as the "bonus/malus" system.

To calculate the actual change in the key components of the cost of owning a car, these indices have been adjusted by the consumer price index in the first graph above.

When price controls were lifted in 1985, the cost of a new passenger car rose in real terms. Subsequently, the successive cuts in VAT rates on new passenger cars, from 33.3% to 18.6% between 1987 and 1992, led to a reduction in new car prices in real terms. Since then, car prices have continued to decline steadily in real terms due to the regular impact of competition

and occasional impact of government support measures ("bonus/malus" system and scrap incentive scheme since 2008).

Actual repair and maintenance costs have risen steadily since 1985, along with the increase in necessary technological investments and the improved qualifications of mechanics. Costs stabilized between 1996 and 2000 as declining component costs were offset by increased labor costs. The index has been rising again since 2002, particularly over the last three years.

In the eurozone (13 countries), Eurostat calculates a new and used car price index; the data from the various countries are then harmonized. Since 1996, the evolution of this index compared with that of the general price index has shown intense pressure, as in France, on prices associated with the stiffness of competition. In 2009, the general price index rose 21% compared to 2000, whilst that of new and used car purchases only grew by 9%.

Consumer spending on private vehicles

The financial and economic crisis has affected household incomes which increased by +1% in 2009.

In view of rising unemployment, households have increased their savings.

As in 2008, the pace of growth in household consumption (in volume) has been substantially curbed, at less than 1%, against more than 2% between 2001 and 2007.

In this context, household purchases of cars supported by the different scrap incentive and "bonus/malus" schemes have risen by 7% to €41 billion; the reduction in average retail prices (more smaller and inexpensive models) that began in 2008 continued in 2009. This expenditure is estimated without any government market support schemes.

Household fuel purchases dropped rapidly (-19% to €32 billion), in line with the considerable price fluctuations. This spending represented 14% less (14% more than in 2008) than new and used car purchases; in 1990 it was a third less.

PERCENTAGE OF HOUSEHOLD BUDGET ALLOCATED TO OWNING A CAR, 1990 TO 2009

TOTAL VEHICLE-RELATED EXPENDITURE

In 2009, French spending on personal transportation most often by car was €138 billion, an amount that represented 85% of all consumer spending on personal and public transportation combined.

Consumer spending on cars, relative to total consumer spending, is expressed as the percentage of household budget allocated to owning a car. This percentage has varied from 9.5% to 11.5% since the start of the 1990s; these macroeconomic data are based on different concepts than those obtained by surveys (see page 46).

Spending on car purchases fluctuates widely, a fact that largely explains most of the changes in the percentage of the household budget allocated to owning a car, and its falling trend. In 2009,

the car budget grew by 0.1 point to 2.9% compared to the lowest point observed since 1990.

The cost of maintaining and repairing vehicles, which increased in the 1990s in line with the end of car ownership access and the increase of the average age of cars on the road, has been oscillating between 3.4% and 3.5% for the last few years. After increasing over several years, household spending on car insurance (representing the service, spending minus repayments) fell by 4.5% in 2009 to €5.7 billion; this figure was €3.7 billion in 1999.

Amount spent by consumers on cars and motorcycles in 2009, according to Insee

Automobile financing

In 2009, 58% of new cars purchased by consumers were bought on credit, compared with over 60% in 2003-2009; the levels of 2001-2002 have been reached.

2009 was marked by the effects of the economic and financial crisis. The fall in retail price of new cars (see page 49) was reinforced by the effects of the scrap incentive scheme. In this climate, car (or conventional) loans were the most common source of financing (43%) almost equal to personal loans (43%) and lease-financing with a purchase option (13%). For new vehicles used by companies (both private cars and light commercial vehicles or heavy trucks), 2009 was marked by sharp drops in loans in line with falling numbers of registrations. In view of the difficult financing, many long-term rental contracts were extended.

in France

TOTAL AMOUNTS OF NEW LOANS GRANTED TO RESIDENTS OVER A 12-MONTH PERIOD

INTEREST ON LOANS, EXCLUDING OVERDRAFTS

Buyers of new and used cars have the choice of paying cash or purchasing the vehicle on credit.

There are three types of financing on offer:

- car or conventional loan: this is provided either by the finance companies, finance subsidiaries of the manufacturers and importers, or by the subsidiaries of financial or banking groups, which are independent from the manufacturers;
- leasing with a purchase option. The lessee has the use of the vehicle and pays rent over the term of the lease, which may be as long as 72 months, i.e. 6 years. The purchase option may be exercised during the lease period or on expiry of the lease;
- personal or bank loans.

Data obtained from a variety of sources (industry associations, registration statistics, surveys, etc.) are used to estimate the percentage of new cars purchased with loans.

Between 2003 and 2007, consumer credit has grown sharply in France: using data over twelve months, new consumer loans (excluding overdrafts) rose from €38 billion in January 2003 to over €56 billion at the start of 2008, an average annual increase of 8%.

Over the same period, home loans rose from 58 to €145 billion, an annual average of 20%. Such growing debt has helped offset lower rises in purchasing power noted by Insee for all households. Since 2008, due to the financial and economic crisis, households have used less credit and considerable drops were recorded: from 8% for consumer loans to 36% for home loans, which returned to their level of the end of 2004.

Car and motorcycle sales and repairs

In France, all motor vehicles are sold and repaired through dealership networks, totalling 15,000 outlets, including around 10,000 for French makes.

In 2009, motor vehicle sales generated revenue of €95 billion (+2% compared to 2007). Per vehicle type, the change is varied: an increase for passenger cars in a market supported by government schemes and a sharp fall for commercial vehicles. Vehicle maintenance/repair also suffered in 2009 (–3.7% turnover), due to falling household spending and heavy goods traffic. According to Insee, vehicle sales and repairs (categorized as J10) involved 76,869 companies at 1 January 2007, just over 6% of which worked for a manufacturer (apart from franchisees) and employed 45% of all staff in the sector. On 1 January 2006 and for car sales alone, a fifth of these companies employed 77% of staff in the sector, on the basis of annual surveys of businesses.

Source: Insee – Trade accounts: provisional results.

Vehicles require special care throughout their service life. This care includes continuous supervision whenever and wherever necessary with optimum servicing in order to maintain the vehicle's initial qualities.

Vehicle manufacturers and official dealers and repair specialists thus work closely to provide maintenance and repairs. They also cooperate to ensure warranty service, driver safety, environmental protection, spare parts availability and information about technical improvements.

To ensure a link between sales and customer support, dealer networks are based on carefully selected distributors and repair specialists capable of meeting make and product requirements.

The automotive industry production and its economic impact

Since 2000, the production of the automotive industry has ranged between €85 billion and €95 billion.

In 2009 it fell sharply by 22% because of the recession to €65 billion. In current euro, it has returned to the level of 1998.

In a very difficult climate for the automotive market, the value added (VA) of the automotive industry has continued to fall, reaching €11 billion in 2009 (or 16% of total production). Its total purchases (or intermediate consumption) down by 25% represented 5 times its VA, at €57 billion, benefiting a number of economic sectors.

The operating margin (ratio between operating cash flow and VA) was 7% in 2008, much lower than the average of the last twenty years (30%). A capital-intensive industry, the gross fixed capital formation (GFCF) in the automotive segment totaled €3.2 billion in 2009, representing an investment rate (GFCF to VA ratio) of 28% (20% overall and 18% for the industry excluding energy).

(1) Accounts for 2008 are semi-definitive, those for 2009 are provisional. (2) Total purchases (intermediate consumption): value of goods and services transformed or consumed fully during the production process. It does not include the depreciation of fixed production assets, which is recorded in uses of capital employed. Source: Insee – National Accounts (2000 base).

In 2009, total purchases as a percentage of production reached 84%, slightly lower than 2007-2008 and equivalent to 2005 figures.

In 2008, over a third of total industry purchases were within the industry and less than two-thirds from other industries. Intermediate goods accounted for less than a third of purchases, including metallurgy; the metalworking industry remained the leading supplier, accounting for 16% of total purchases.

The commercial sector accounted for 16% of purchases. The most requested corporate services were research and development (5%), consultancy and support (4%), and operating services (3%).

Purchases of capital goods (mechanical, electrical and electronic equipment) accounted for 9% of total industry purchases.

7%

Operating margin of the automotive industry in 2008, far below the average observed over the last twenty years (30%)

Automotive OEMs and suppliers

French automobile manufacturing acts as a structure for its suppliers and the French economy as a whole.

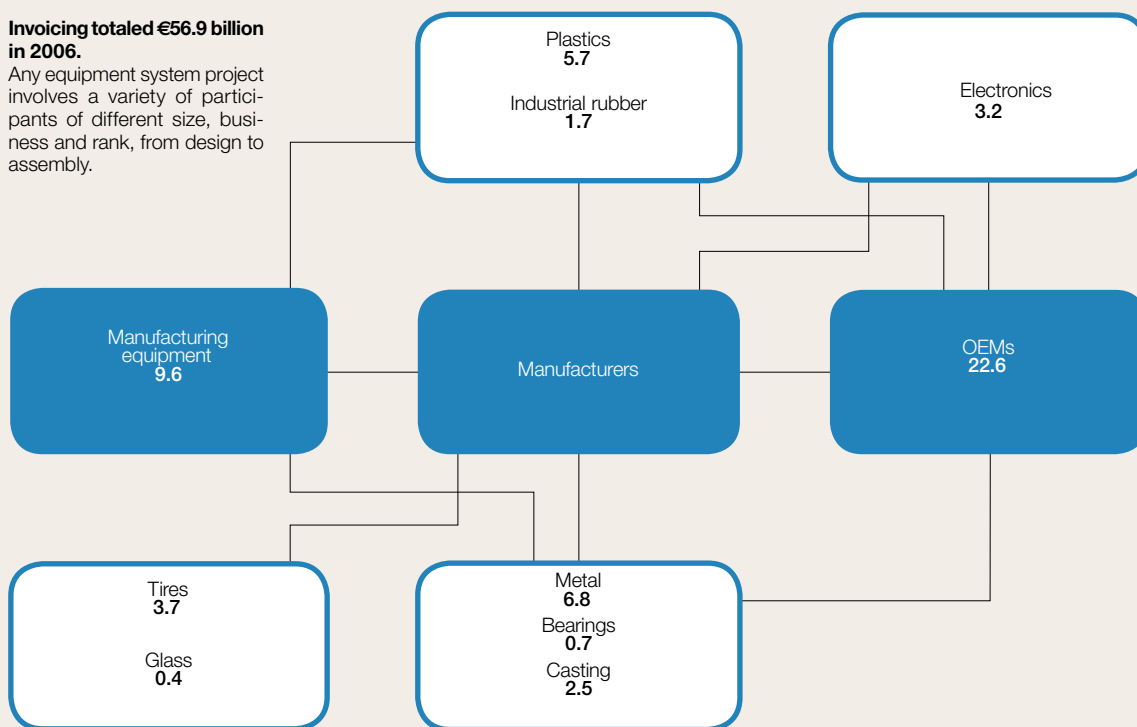

The industry drives the OEM and supplier sectors, such as plastics, industrial rubber, casting and industrial metalworking services, etc.

In 2008-2009, the financial and economic crisis severely affected manufacturers' production as well as that of the OEM and other supplier sectors.

FRENCH SUPPLIER CHAIN ACCORDING TO SESSI IN 2006

Invoicing totaled €56.9 billion in 2006.

Any equipment system project involves a variety of participants of different size, business and rank, from design to assembly.

A variety of participants of different sizes, businesses and ranks contribute to automotive manufacturing.

Partnership solutions can also be very varied as shown by studies conducted by the *Service des Etudes et des Statistiques Industrielles* (Department for Industrial Studies and Statistics - SESSI) on the automotive supplier chain. The automotive industry comprises automotive manufacturing and suppliers. In recent years, outsourcing has meant increasing reliance on suppliers, whose services represent a large and growing proportion of the total cost of vehicle manufacture (about three quarters according to the French Automotive Equipment Industries Association - FIEV).

According to SESSI, the French automotive industry, which leverages the French industrial base, made purchases of nearly €57 billion from its suppliers in France in 2006.

It accounted for more than half of the engineered plastics parts business, and around half of industrial rubber markets, the casting business, and industrial metalworking services, which include cutting, stamping, industrial mechanics, machining, forging, drop forging, die forging, and metal coatings.

When expressed in jobs, these purchases highlight the automotive industry's significant contribution to industry and the French economy.

1st

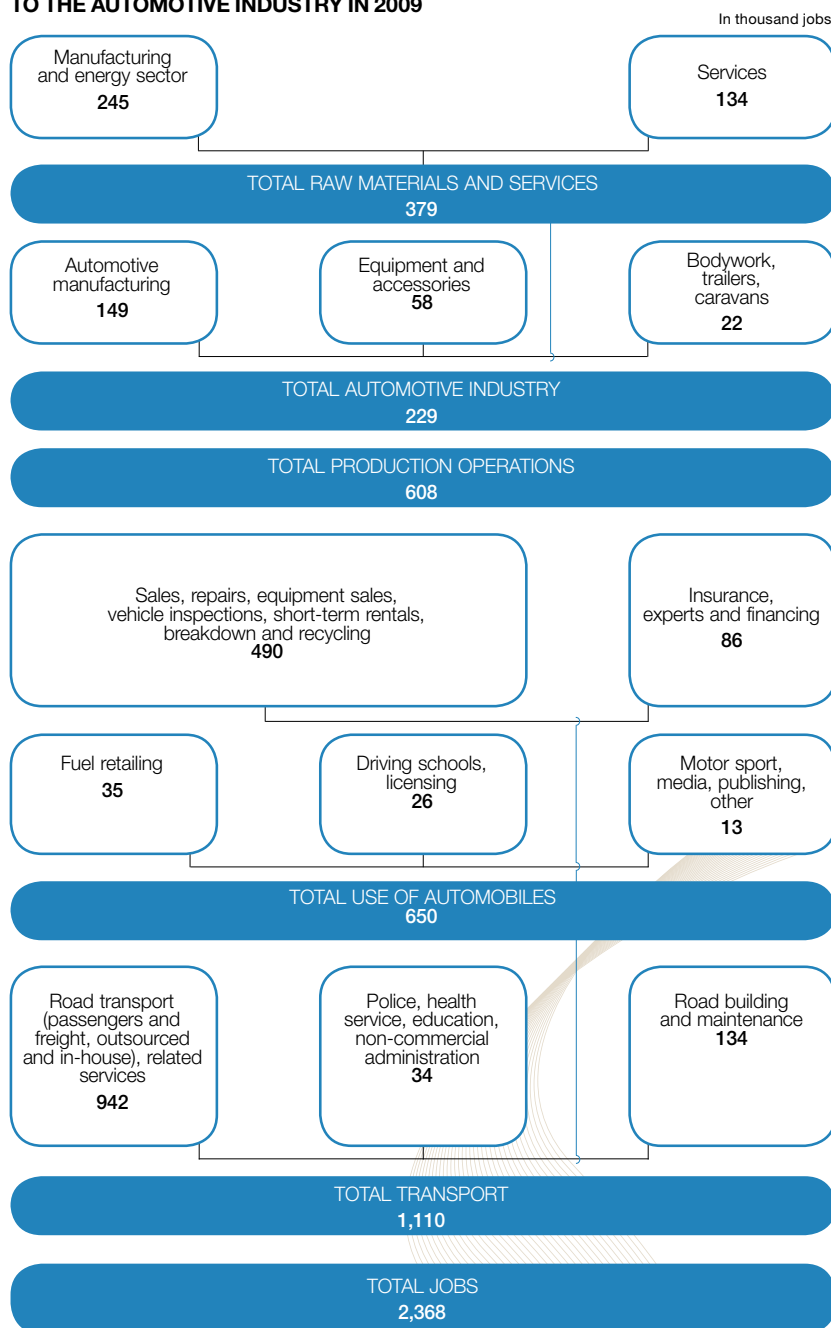

The French automotive industry remains the largest customer of many sectors such as plastics, industrial rubber and industrial metalworking

Employment

In the broadest sense, in 2009 the industry provided work for close to 2.3 million people, representing 9% of France's employed working population. The automotive industry alone directly employed 229,000 people, representing more than 9% of all employment in the manufacturing and energy sector. The effects of the financial and economic crisis that started in 2008 were sorely felt in industrial branches and those associated with vehicle use, particularly for heavy trucks, and transport.

JOBS RELATED DIRECTLY OR INDIRECTLY TO THE AUTOMOTIVE INDUSTRY IN 2009

Sources: CCFA, CNPA, SESSI, Insee, SOeS, URF and USIRF.

GEOGRAPHIC BREAKDOWN OF AUTOMOTIVE INDUSTRY EMPLOYEES IN 2007

Source: SESSI.

As the driving force behind industrial output in France, the automotive industry and its suppliers directly and indirectly created 608,000 jobs either in production or through its purchases from other sectors.

Vehicle usage provided jobs for more than 650,000 people, particularly in the areas of vehicle-related services (sales, repairs, automotive equipment retailing), fuel and recycling (oil recovery and car breakers).

Finally, the road transport (passenger and freight) sector and its related infrastructure employed more than 1 million people. These jobs include both outsourced and in-house transport operations.

In a broader sense of freight transportation and logistics (storage and related services), the French Transportation Ministry's Statistics Department (SESP) carried out a multi-sector analysis that showed there were 1.5 million employees in this sector in 2004.

In the past, most jobs in the automotive industry (manufacture and equipment) were located in the Greater Paris area but the industry has since become more decentralized, with only 12% of all employees still based in the Paris region in 2007.

The other main automotive regions are Nord-Pas-de-Calais (13%), Franche-Comté (10%), Upper and Lower Normandy (both 10%), Rhône-Alpes (10%), and Alsace and Lorraine (8% each).

(1) New member states: 8 countries in 2000; 10 countries in 2006.

World production of French automobile manufacturers

In 1998, French manufacturers began reporting their production as the number of vehicles assembled at the rollout location. The concept of KD and CKD units has been abandoned. Aggregate data for 1996 and detailed data for 1997 have been restated using the new definitions.

(1) Including Talbot up to 1985.

(2) Renault acquired Dacia in 1999 and Samsung Motors' assets in September 2000. The Renault Traffic II is manufactured by IBC, a General Motors subsidiary, in the United Kingdom and by Nissan in Spain. As of 2006, some Renault Traffic II vehicles are classified as passenger cars.

(3) Mack was included in Renault V.I. between 1990 and 2000. In 2001, Renault and AB Volvo pooled their truck operations.

(4) On 1 January 1999, Renault V.I. (Renault Trucks) sold its coach and bus business to Irisbus, part of Iveco.

Deliveries of French automobile manufacturers outside France

As of 1996, deliveries of French manufacturers include both assembled vehicles and KD/CKD units. Vehicles delivered to French Overseas Departments are no longer counted in deliveries outside France. Dacia's deliveries are included in the scope of consolidation as of 2005, Renault Traffic's are included as of 2006, and Renault Samsung Motors as of 2007 (180,973 passenger vehicles). Also, certain deliveries are assigned to regions but not countries.

(1) As of 2004, deliveries to Cyprus are included in Europe, rather than Asia.

(2) European Union: 9 countries in 1980; 10 countries in 1985; 12 countries between 1990 and 1994; 15 countries between 1995 and 2003; 25 countries from 2004 to 2005; 27 countries since 2006.

(3) CEE/CIS: excluding the 10 new countries that joined the European Union in 2004 and 2005, and the 12 that joined in 2006.

Physical and financial data for the automobile manufacturing industry

Physical and financial data are taken from surveys (known as the EAE reports) conducted every year of French companies in the automotive manufacturing industry. The surveys are one of the main sources of information for French industry. The SESSI, formerly the statistics department of the Government Secretary for Industry now attached to Insee, uses the surveys. These data reflect the businesses of French and foreign-owned companies with operations in France. Their core businesses may extend to other countries. Changes such as the creation, reorganisation, acquisition or sale of companies can result in significant variations from one year to another. A significant overhaul of these surveys is currently in progress which explains why this data is not available after 2007. The future data will be available through a new business nomenclature.

Physical and financial data on the automotive equipment industry

Physical and financial data in the table below are taken from surveys (known as the EAE reports) conducted every year of French companies in the automotive equipment manufacturing industry.

In 1993, new French definitions of activities were adopted to bring them in line with those used by the European Union. A number of companies were reclassified in the metalworking, electrical equipment and car seating industries, resulting in a statistical break in data.

Companies listed in the “automotive equipment manufacturing” sector do not represent, therefore, all suppliers of the automotive industry. Added to these should be manufacturers of electrical materials (for engines and vehicles), car seats, glass, tires, doors and locks and automotive springs (see page 53).

In addition to these activities, the automotive manufacturing and automotive equipment manufacturing industries purchase a number of intermediate products (metals, rubber, plastics, etc.), services (consulting, research, advertising, etc.) and capital goods from other sectors.
