\title{
Growth returned in 2014, along with an inversion in the production curve. This leap forward is the outcome of investments, innovation and competitiveness agreements in France.
}

\author{
PATRICK BLAIN,
}

CHAIRMAN OF CCFA

In 2014, the global auto industry expanded by 3\%. Does this indicate the start of the exit from the crisis?

PATRICK BLAIN: 2014 represented a positive change for some countries, but a negative one for others. The crisis is deepening in the emerging countries, while the mature countries, including the United Sates, are heading for an exit from the crisis. However, overall, it is still present.

The markets are being turned upside down: Europe is making a comeback, Russia is collapsing, and China is hanging on. Is this a long-term trend?
P. B.: Given the rates of vehicle ownership in China and India (20 cars per 000 inhabitants in India), it is clear that we will soon bounce back to a standard situation with Europe, whose market is stabilising, and emerging countries that are once more beginning to... emerge.

There have often been criticisms in the past about French auto makers concentrating too much on Europe. Yet the "old" countries bounced back strongly in 2014. Were the French on the right track?
P. B.: The situation is not the same between the two groups. It never makes sense to be on one small portion of the world market, yet not on another. The French market represents just less than 2.5\% of the world market, compared with 20\% for that of Europe. Regardless of its home country, an auto maker needs to be as active as possible in all markets and to expand its production in all of them. Since there is an imperative to build cars nearer to customers, it only stands to reason that production at home will continue to decline. Conversely, one needs to watch that the decline in value is as small as possible. All the
same, France did not do too badly in 2015, with production in the first quarter rising by \(6 \%\) over 2014.

Due to many company-level labor agreements and the use of the CICE*, competitiveness is back in the factories of the French auto makers. Is it sufficient to reduce the gap with Germany in this field?
P. B.: Yes, the gap is narrowing, and that is largely due to the in-house efforts of the French companies, which are improving their competitiveness. This can be seen in the classic indicators on the subject. Furthermore, it is significant to see that each of our auto makers has succeeded in convincing its partners to produce in France. PSA for Toyota at Valenciennes, and for GM at Sochaux; Renault for Mercedes in Maubeuge, for Nissan in Flins, for Nissan and GM at Batilly and in Soundouville, and Renault Trucks for Volvo Trucks at Blainville.

\section*{It would appear that our car}
builders' factories are specialising simultaneously in the utility, where our know-how is unanimously recognised, and in the upscaling of models aimed at individuals. Do the results prove them right?
P. B.: Yes indeed. The common element in these two segments is their strong content of value added. Just as it is true that manufacturing a product with little value added in France has become economically impossible, similarly the inverse is economically fair. Particularly with products with a high innovation content, such as electric and hybrid vehicles. Partially, that is what explains the French auto makers' strength in utilities. By adding what we produce for our partners, that represents \(40 \%\) of the market.

French auto makers can boast vehicles that are among the most virtuous in the world when it comes to polluting emissions,
in both gasoline and diesel models. However, the versatility of the governments and the punitive tax plans for diesel, as well as the negation of the very low emissions of the Euro 6 diesels are causing French buyers to switch to gasoline engines. Doesn't that risk being harmful for our auto makers?
P. B.: Our politicians' attitudes are absurd and paradoxical: just when the modern diesel engine is reaching emission levels comparable with those of gasoline engines, with Euro 6, they are increasing the load against diesel. While that is easily understandable when it comes to the old diesel models, it is ridiculous considering Euro 6. What is even crazier is that we are just a few months away from COP21 and diesel provides \(15 \%\) in \(\mathrm{CO}_{2}\) savings! This represents a considerable challenge for the planet and for consumers, since it is also \(25 \%\) less consumption of fuel, saved by our customers. The play of these positions, solely motivated by political considerations, has a dreadful influence on employment in our French factories. This will also add an additional difficulty in reaching the goal of 95 g of \(\mathrm{CO}_{2}\) per kilometer by 2021. It is even paradoxical to see that this movement is precisely in the opposite direction from what is happening everywhere else in the world, where the market share of diesel is expanding naturally or even thanks to help from subsidies, as in Japan.

The French auto industry is still investing a great deal in R\&D, since it is the leading filer of patents, ahead of the pharmaceutical industry, thanks-among other things-to the research tax credits. Is R\&D an essential feature of our industry?
P. B.: Very much so. In such a competitive industry, alongside competitiveness it is innovation that is the key to survival. Innovation by the
auto makers, of course, but actually by the entire industry. It is really the backbone of the vehicle industry via its projects such as the 2 liters per 100 km vehicle (accounting for €6 billion in R\&D expenses in 2013). It is all the more important for jobs, since R\&D for French companies is focused overwhelmingly in France.

\section*{Despite the economic crisis and} wildly fluctuating markets, the auto industry remains one of the strengths of the French economy, via its auto makers, but as well via their suppliers, and then, in addition, there are the taxes gathered from the sale of fuel. How is 2015 shaping up?
P. B.: 2015 is rather different from what has come before, with markets inverted, though that is not sustainable. The European and French markets are rising solidly, even though they are still \(15 \%\) beneath the pre-2008 crisis values. Overall, the global market will continue rising by \(2 \%\), such that by 2020 , there will be 100 million vehicles sold, since automobiles are becoming more important for mobility and the world economy.
In all automobile producing countries in the world, policy is in place to serve the industry. It would not make sense to do any differently in France, where the automobile industry represents \(16 \%\) of industrial earnings and the automobile industry as a whole provides \(10 \%\) of jobs.

\footnotetext{
*The tax credit for competitiveness and jobs.
}

\section*{The French Automobile Manufacturers' Association}

Comité des Constructeurs Français d'Automobiles (CCFA) is the French automobile manufacturers' trade association.
Its members are: Alpine, PSA (Automobiles Citroën - Automobiles Peugeot), Renault and Renault Trucks. Its mission is to study and defend the business and industrial interests of all French automobile manufacturers on both national and international levels (excluding labor issues which are the remit of the UIMM - the union of specialties and metallurgical industries).
CCFA's activities encompass information, analysis and communication for its members as well as for government agencies, public officials, members of parliament, the manufacturing sector, the automotive and road industry, research bodies, the media and the general public. Other sectors of the automotive industry (parts and equipment manufacturers, dealers, body manufacturers) have their own trade associations (FIEV, CNPA, FFC, Fédération des Industries Électriques, Électroniques et de Communication - Electrical, Electronic and Communications Industry Federation, Fédération des Industries Mécaniques - Mechanical Industry Federation, Fédération Forge Fonderie - Forging Foundry Federation, Groupement Plasturgie Automobile - Automotive Plastics Group, Syndicat National du Caoutchouc et des Polymères - National Union of Polymers and Rubber Industries, etc.). In 2009, during the crisis, French automobile manufacturers and their suppliers came together within the Liaison Committee of Automotive Suppliers (CLIFA - Comité de Liaison des Fournisseurs de l'Automobile) to establish the Automotive Branch Platform (PFA - Plateforme de la Filière Automobile), which has the task of contributing to reinforcing the French automotive industry. Among the various committees making it up (including strategy and competitiveness, industrial performance, trades and skills), in 2012 the Comité Technique Automobile (CTA - Automotive Technical Committee) was added, along with its two boards, the Comité de Standardisation Technique Automobile (CSTA - Automotive Technical Standardization Committee) and the Comité de Recherche Automobile (CRA - Automotive Research Committee), their role being to guide research and development.
Foreign brands are represented by the Chambre Syndicale Internationale de l'Automobile et du Motocycle (CSIAM - International Association of the Automobile and the Motorcycle). CCFA is associated with Brussels-based ACEA, the European Automobile Manufacturers' Association. It is also a member of OICA, the International Organization of Motor Vehicle Manufacturers, which brings together national associations representing the industry from around the world.

\section*{"A global automobile market growing less energetically and with highly contrasting local developments"}

The major markets for French companies outside Europe are in the emerging economies. However, since the end of 2013, they have been in freefall, except for China. At the same time the European markets, which had fallen and have been at extremely low levels since 2009, have begun to recover, which means that French automakers can deal with these cyclical fluctuations.
Production by French manufacturers has declined by 8\% compared with the level prior to the 2008 financial and economic crisis; meanwhile emerging economies have experienced significant growth until 2013. These economies, like the United States, have surpassed their pre-crisis levels by a great deal, whereas in other developed countries-including the eurozonethat is not yet the case. Sales outside of Western Europe have risen by more than 940,000 units since 2007, reaching 3 million vehicles in 2014. These regions where the level of vehicle ownership is generally much lower than in Western Europe (20 vehicles per 1000 inhabitants in India; 91 in China; compared with 564 in the European Union) represent markets of large potential within which European manufacturers would be wise to continue and expand their investment, regardless of cyclical fluctuations. The market in Western Europe, a mature automobile zone, remains the base market for French manufacturers. They declined by more than a million vehicles over the period 2007-2013, to 2.8 million, chiefly as a result of the collapse of the markets in southern Europe and in France. In 2014, registrations in Western Europe jumped to three million units, a lift of more than 200,000 units. To weather the development of overseas competition, French manufacturers continued to ensure the future through investment in France in research and development and also plants.

\end{tabular}

In addition to the collapse of Western Europe's base market in terms of the levels observed prior to the crisis, French automobile manufacturers must deal with a variety of factors. Consumers are having to make hard decisions about what to buy. In France, expenditure on automobiles now represents less than nine per cent of household consumption, compared with nearly \(11 \%\) in 1990. The cost of a car purchase is now less than the expenditure required to use a vehicle (not counting fuel), and the decline in these purchase expenses occurs to the detriment of the new vehicle market. In addition, price rises of raw materials are impacting the manufacture process. Raw material prices remained near record highs up to 2011, near the peaks of 2008, especially in the case of oil. They have declined somewhat since then, but remain high. The higher cost of financing and/or the reduced availability of short- and long-term capital, made worse by the crisis, and the continuing strength of the euro until summer of 2014 against other main currencies also impacted the business of French companies. Despite everything, they must continue to meet society's demands (in terms of the environment and safety, for instance), which requires considerable research and development expenditure. This means that their line-ups are increasingly "green." In France, average \(\mathrm{CO}_{2}\) emissions per km of new passenger cars have fallen by 35 grammes since the introduction of the "incentive/penalty" [or "bonus/malus"] system. The amount of \(\mathrm{CO}_{2}\) produced by heavy trucks to move a metric ton of goods one kilometre has also fallen (by 29\%). In 2014, in Western Europe, the new vehicle markets made progress, especially due to the vitality of the United Kingdom market and the recovery of the Italian and Spanish markets. These improved conditions have boosted the market share of French manufacturers, though it remains below its 1997 level, in a context of even stiffer competition. The share of European sales in the totality of French companies' sales will not last, due to the differences in vehicle density between that mature region and the emerging economies. These French manufacturers produced only \(60 \%\) of their vehicles in their home region in 2014, compared with \(80 \%\) in 2006. In Eastern Europe, markets rebounded in the member countries of the European Union, but declined elsewhere, e.g. in Russia. The rise in the Asian market in general reflects the strength of the growth in sales in China, which has been the biggest auto market since 2009. Results elsewhere in

Asia were heterogeneous: a drop of more than 30\% in Thailand, declines in India and Indonesia, steady growth in Malaysia. Sales of French vehicles in the region -one million units-grew strongly in 2014 (an increase of \(18 \%\) ). After four good years, the bottom fell out of the market in Latin America, and French manufacturers felt the effects.
To conclude, opportunities for French manufacturers shrank in Africa; sales of 270,000 vehicles in a less vibrant market.
In emerging countries, where opportunities are expected to grow long-term, French manufacturers continue to expand in terms of both sales and production, with or without a partner, to assuage the thirst for car ownership. They have resolved to make new investments and to overhaul and adapt their line-ups. Their efforts are particularly noticeable in Asia (PSA Peugeot Citroën with its two partners in China, in addition to Renault in both India and China).

\section*{World motor vehicle production}

In 2014, world vehicle production grew by \(2.7 \%\) to 89.9 million vehicles, which is the fourth record since the 2009 decline. This increase represented a volume of 2.3 million vehicles. Worldwide production of vehicles was around 50 million units in 1990, growing to nearly 60 million in 2000 . Before the 2009 crisis, when it plummeted, it exceeded the threshold of 70 million vehicles. Since 2000, the annual growth rate has been an average of three per cent (3\%). In the developed regions, there is no consistency to the way production levels have developed compared with those of 2007: production fell in Western Europe (down 19\%) and in Japan (down 16\%), while it is up 13\% in the NAFTA countries (Canada, USA and Mexico) and up \(11 \%\) in South Korea. In emerging economies which are currently the main areas for growth in the automotive industry, production is a much higher than before the crisis. In 2014, it grew by 53\% compared to 2007 levels in Asia-Pacific (more than doubling in China, up 167\%); it remained stable in Latin America; and grew 20\% in the new EU member states.

Source: OICA, CCFA estimates for July 2015

CHANGES IN WORLD MOTOR VEHICLE PRODUCTION SINCE 1990

89.9

MILLION
NEW RECORD FOR THE NUMBER OF VEHICLES PRODUCED IN THE WORLD IN 2014

In Western Europe, production grew by 3\% in 2014, with
highly disparate outcomes. Countries such as Spain (up \(11 \%\) ), Italy (up 6\%) and France (up 5\%) are starting to take advantage of the slight recovery in the European market, while others-which lean more toward exports outside the EU-are consolidating their positions (Germany: up \(+3 \%\), United Kingdom: up 0.1\%).
In the Americas, production continue to expand steadily in the NAFTA countries (up 6\%), but it collapsed in South America (down 17\%), back to pre-2009 crisis levels. As regards Asia-Pacific, which represents more than half of
world production, growth of production in Indonesia (8\%) increased, though at a slower rate than in previous years. In China, leading manufacturing country since 2008, production rose by \(7 \%\). Conversely, it fell in Malaysia (by 1\%) and Thailand (by 23\%). Production was stable in South Korea, and up slightly (2\%) in Japan.

Between 2010 and 2014, global production of vehicles (amounting to 89.9 million) increased by \(16 \%\), but the results differed greatly among regions. In developed economies, production dropped by nearly 5.4 million vehicles ( \(+13 \%\) ), reaching a level of 45.2 million units. This only accounted for half of the world's production, i.e., one percentage point less than in 2010. Within these regions, North American production increased by 5.3 million units (43\%), while production in Western Europe declined by 300,000 (2\%). Japan's production increased by around 150,000 vehicles in 2014 ( \(2 \%\) greater than in 2010). On the other hand, production in South Korea-a country which has benefited from more favorable exchange rates-grew by more than 250,000 units (+6\%). In developing regions and countries, production grew by 7.1 million vehicles, relying on the following five zones:
- China (up 5.5 million), which represented \(26 \%\) of world production in 2014, compared with \(24 \%\) in 2010;
- Central and Eastern Europe and Turnkey (up 1.1 million, and market share of 8\%, up from 7.8\%);
- Indonesia, Iran, Malaysia and Thailand (up 350,000, and market share of 5.8\%, up from 5.4\%);
- South America (down 400,000, and market share down to \(4.2 \%\) from \(5.4 \%\) );
- India (up 300,0000, and market share down to 4.3\% from 4.6\%).

Overall, the market share of these emerging countries or regions rose from \(43 \%\) to \(45 \%\) in this period.

WORLD PRODUCTION ALL VEHICLES

\section*{Developed regions and countries}

\section*{World rankings of automobile manufacturers}

The 13 leading manufacturers-including French groups PSA Peugeot Citroën and Renault-account for around 80\% of the world's production, producing more than two million vehicles each. The weakness of the European market hit the performance of PSA and Renault hard, knocking them to tenth and eleventh place respectively in the world ranking. As in 2013 and at the time of the last crisis (in 1997), the production of the French automakers accounted for \(6 \%\) of world production, a level far beneath the \(9.8 \%\) top figure achieved in 2001.
The automakers became much more international in scope after 2000 and continue developing industrial sites outside their home region. European, U.S., Japanese and Korean car makers, which produced 60-70\% of their output in their home regions in 2000 now only produce 40-50\% there. Even manufacturers in emerging countries, such as Geely or Tata, which purchased European manufacturers, now only produce about half their output in their home region.

Note: The production of Chinese manufacturers does not include joint-ventures.
(1) The vehicles include passenger cars, light commercial vehicles, heavy industrial vehicles, and coaches
and buses. There may be double accounts between manufacturers.
(2) The output of GM and Ford include their activities in China.

Sources: OICA, CCFA estimates for July 2015.

SHARE OF THE HOME REGION OF THE MANUFACTURER AS A PERCENTAGE OF ITS TOTAL PRODUCTION

In a context of dynamic growth, world production rose by \(3 \%\), while results differ depending on the company.
Toyota Group, ranking first since 2006, continues to advance (up 1.5\%) due to its presence in many markets. GM and Ford keep

MARKET SHARE OF FRENCH MANUFACTURERS IN WORLD AUTOMOBILE PRODUCTION IN 2014
their volume positions as a result of the healthy state of the North American market. Volkswagen Group (up 5\%), with a solid presence in emerging countries, advanced from third place in 2013 to second in 2014.
Among the Asian manufacturers, Hyundai-Kia (up 6\%/4th position), Nissan (up 3\%/6th position) and Honda (up 5\%/8th position), and Suzuki-Maruti (up 6\%/9th position) retained their places.
The European groups are increasing their output, particularly the generalists PSA Peugeot Citroën (up 2.9\%), Renault (up 2.1\%) and Fiat (up 3.9\%), and the German upper-scale manufacturers BMW (up 8.7\%) and Daimler AG (up 8.5\%).

Manufacturers in emerging countries (China, India) also have different rates of growth. Some have increased output: Changan ( \(+30 \%\) ), SAIC ( \(+17 \%\) ) and Dongfeng Motor ( \(+5 \%\) ); while Tata experienced a significant decline ( \(-11 \%\) ).

\title{
Trends in production and trade among the world's three leading automotive regions
}

Whereas the European Union (now 28 countries) was market leader for many years, since 2010 it has become the world's second production zone, whilst remaining open. The collapse of its domestic market from 2008 to 2013 explains the reduction of both imports and production. Its expansion of exports ( \(29 \%\) of production) has not been enough to make up for this sharp drop in production for the domestic market. In 2014, all these indicators made a recovery.
In North America, including Mexico, production continued to rise, though it is still 300,000 vehicles below the record of 2000. Production is intended for the local market, and exports represent just 10\% of production. In Japan, exports represent 46\% of production. Imports still only account for less than \(5 \%\) of total car registrations. Outside of these three historical regions, China, which became the largest producing country in 2010, essentially only produces to satisfy its domestic market: imports ( 1.4 million vehicles), just like exports ( 0.9 million units) represent around \(5 \%\) of production.

\section*{46\%}
percentage of vehicles
MANUFACTURED FOR EXPORT
IN JAPAN IN 2013

Trends in the three leading world automotive markets have contrasted sharply since 1990. In the European Union (now 28 countries) vehicle production increased by nearly \(20 \%\) (compared to \(+38 \%\) in 2007) and trade-already importantappears up by 100\%. In North America, including Mexico, production has risen since 2009 by 49\% over its 1990 level Imports, which were already large in 1990 and which had since continued to rise, were \(25 \%\) greater than those of 1990. Exports only represented \(10 \%\) of production ( \(29 \%\) for the EU and \(46 \%\) for Japan). Finally, in Japan, vehicle pro-
duction increased by \(26 \%\) due to the rising domestic and export markets. These markets, which had suffered a decade of decline until 2001 ( \(29 \%\) lower than 1990), had previously grown sharply as the yen weakened and, in 2008, were \(15 \%\) higher than in 1990. In 2014 they were \(23 \%\) lower, chiefly due to the production of plants belonging to Japanese manufacturers outside of Japan.

\section*{World vehicle markets}

In 2014, the world automotive market continued to grow (up \(3 \%\) to 88.3 million vehicles), setting a new record for the fifth year in a row. Markets expanded, with the exception of Central and Eastern Europe, South America and the ASEAN countries (Association of South East Asian Nations).
The five leading markets in the world (China, USA, Japan, Brazil and Germany) account for sixty per cent ( \(60 \%\) ) of world sales. In 2005, China took third place in the rankings, and Brazil tenth.
In the main industrialized regions, where vehicle ownership rates have achieved maturity, the markets remain well under the levels previously seen, despite the advances in recent years, and their share of the world markets was only \(47 \%\), compared with \(68 \%\) in 2005. In the emerging economies, markets are trending down from their highs.

(1) NAFTA: Canada, USA, Mexico. (2) ASEAN: Brunei, Cambodia, Indonesia, Laos, Malaysia, Myanmar, Philippines, Singapore, Thailand, Vietnam. Source: OICA.

In the United States, the market continued to expand, after the low point of 2010, to reach nearly 17 million vehicles, and so came near to its average level of the mid-2000s.
In Western Europe, the market rebounded after six low years, to 13.9 million vehicles, against 17.3 million in 2007 . The countries all had different fates, from a \(6 \%\) fall in the Netherlands to a \(36 \%\) rise in Portugal, and encompassing a 3\% rise in Germany. The market in Spain grew 20\% due to successive renewals of the demand support plan that began in 2012.
In Central and Eastern Europe, the fast growth of the years stalled again (a 10\% drop) after that of 2012. The Russian and Ukrainian markets slumped (by \(15 \%\) and \(55 \%\) respectively).
China, where access to vehicle ownership is constantly expanding, in pace with the rise in its standard of living, saw its market increase by more than \(7 \%\) to 23.5 million vehicles, despite the limitation on the number of new vehicles in large cities. Its status as the world's leading automotive
market remains intact. Sales were on an upward streak again in Japan (a \(3 \%\) rise). However, they are still lagging the healthy sales of the 2000s. Registrations in South Korea took of by \(11 \%\) to 1.7 million vehicles after declining for two years in a row. In the Asia-Pacific region (excluding China, Japan, and South Korea), growth took hold again (up \(2 \%\) to 11.9 million vehicles). However, the performances of the countries making up the region varied greatly: the Philippines saw a rise of \(27 \%\), while India experienced a \(2 \%\) drop; sales fell \(34 \%\) in Thailand.
In South America, the market slumped 11\% after four years of increase, though at a decreasing pace. The Brazilian market fell significantly (7\%). Volumes were lower in Africa, but markets continued to grow, though Algeria recorded a decline of around \(20 \%\). The two other major markets in the region, Morocco (up 1\%) and South Africa (down \(1 \%\) ) were relatively stable.

THE WORLD'S LEADING MARKET SINCE 2009

\section*{The world's vehicle fleet}

In 2013, the world's fleet of vehicles (passenger cars and commercial vehicles) stood at 1.2 billion units (of which more than \(70 \%\) were passenger cars), representing a rise of \(3 \%\) over the prior year. Numbers of vehicles are practically stable (with rises between 0 and \(1 \%\), inclusive) in the developed countries, where markets are mature, and growing strongly in the emerging markets. The USA has the most vehicles in the world-250 million-ahead of China ( 127 million) and Japan ( 77 million). France comes in eighth place worldwide ( 38 million units) behind Brazil, which rose one place from 2012. Vehicle density in the world was on average 174 vehicles per thousand inhabitants-up \(+21 \%\) over 2005. However, density figures vary from 43 vehicles per thousand inhabitants in Africa to 649 in the NAFTA zone (USA, Canada and Mexico). Asia (excluding Japan and South Korea) has a density of 67; South America -167; while Europe, Japan and South Korea boast densities of greater than 500.

\hline
\end{tabular}
(1) NAFTA: Canada, USA and Mexico.

Source: OICA.

In 2013, the mature regions represented 60\% of vehicle ownership and 17\% of the world's population. Those regions have lost around 10 points to the emerging economies since 2005. Within the Europe zone, where more than a third of the world's cars reside, vehicle ownership expanded more in the east than in the west (cf. p. 19). The rate of vehicle ownership varies in Europe, from 148 in Albania to 737 in Iceland; nearly a quarter of Romanians own vehicles (253), while the range for the major West European countries is 550-600. The number of vehicles in this region rose by nearly 50 million units over 2005, of which three quarters outside of Western Europe (Russia added 13 million units). In the Americas, the NAFTA zone accounts for \(26 \%\) of the world's vehicles, the United States boasting a level of vehicle ownership of 790 per 1,000 inhabitants. The picture is different in South America, an emerging region, which accounted for just \(7 \%\) of the world's
vehicles in 2013. Ownership density in South America is just 167 per thousand. The number of vehicles in America has grown by more than 30 million units since 2005, in nearly equal portions between the NAFTA countries and South America. The three countries with the greatest increase in number of vehicles are Brazil, the United States and Mexico, with, respectively 17,15 and 13 million units. In the mature markets of Japan and South Korea (together \(8 \%\) of all cars in the world), ownership density is 603 and 394 respectively. The picture is different in more populous developing countries, where density is low: India - 20; China - 91; and Indonesia - 77. Since 2005, nearly the entire rise in number of vehicles occurred in Asia, outside of Japan and South Korea, with China (adding 95 million units) far ahead of India (which added 15 million) and Indonesia ( 10 million).

\section*{World trade in automotive products}

Global trade in automotive products grew by 4\% in 2013, according to the World Trade Organization (WTO), valued at US \(\$ 1.350\) billion, \(9 \%\) above the level reached in 2008. Between 2005 and 2013, very different changes were detected between countries and regions in the balances of products from the automotive industry. The surplus in South Korea rose from US \(\$ 34\) billion to US \(\$ 64\) billion; in Japan it rose from US \(\$ 110\) billion to US \(\$ 131\) billion and in the EU it rose from US \(\$ 80\) billion to US \(\$ 188\) billion. Despite a markedly lower automotive market in 2013 than in 2005, the US deficit remained quite high, and increased to US \(\$ 126\) billion. On the other hand, the positive balance of US \(\$ 9\) billion recorded in Canada in 2005 became a US \(\$ 12\) billion deficit, as a result of the place taken by Mexico in trade within NAFTA. In Brazil, the US \(\$ 7\) billion

(1) Since 2005, exports to North America mainly target the USA, Canada and Mexico.
(2) For the comparisons, 15 EU countries have been included since 1993, 25 since 2004 and 27 since 2006.
(3) Since 2001, CCFA has based its estimates of imports and exports for European Union countries on local customs statistics.
(4) The "other countries" total contains countries not included in the three major divisions.

Source: GATT/WTO

RECORD LEVEL
OF CHINESE IMPORTS
IN PRODUCTS
of the automotive INDUSTRY

In 2013, world trade in automotive products accounted for \(\mathbf{7 \%}\) of the world's goods exports and \(11 \%\) of the world's manufactured product exports. 2013 was marked by a \(3 \%\) rise in the value of the euro against the dollar, whereas the exchange rate between the yen and the dollar plummeted by \(18 \%\).
In light of low market levels in the NAFTA countries and the European Union, the share of intraregional trade in world trade continued its fall, going as low as \(59 \%\) in 2012 (as against \(64 \%\) in 2007). In NAFTA and Europe (excluding CIS), this share exceeded \(70 \%\) and in South America it exceeded \(80 \%\), while it was hardly more than \(30 \%\) for Asia-Pacific. In 2013, Germany was still the largest exporter of automotive products with an \(18 \%\) share worth 237 billion dollars.

Japan, in second place, exported goods to the value of US \(\$ 152\) billion, of which US \(\$ 57\) billion to North America (making up \(38 \%\) of its total exports, compared with more than \(50 \%\) at the start of the 2000s). Japan's exports to China dropped to US \(\$ 14.2\) billion from 2011 to 2013, due to the geopolitical situation. By comparison, Japan exports goods valued at US \(\$ 13.9\) billion to the EU-28.
EU-28 automotive exports reached \(\$ 659\) billion. Trade within the EU accounted for over \(61 \%\) of this total ( \(73 \%\) in 2009). Exports from the EU to China were valued at \(€ 40\) billion. EU exports to Russia were valued at US \(\$ 20\) billion; to Africa - US \(\$ 20\) billion; and to the Middle East - US\$14 billion. On the basis of Eurostat data, more than half of the EU's exports to non-EU countries are due
surplus gave way to a US\$9 billion deficit. The deficit of China, which meanwhile became the world's leading vehicle market, grew from US\$4 billion to US\$32 billion. India's surplus grew from US\$1 billion to US\$6 billion, on the back of an expansion of exports, from a value of less than US\$3 billion to more than US\$11 billion. Not counting intra-zone trade, imports to the European Union were overtaken for the first time by those to China (at a value of US \(\$ 64\) billion vs. US \(\$ 78\) billion) in 2013. Nonetheless, these levels of imports lag those of the NAFTA countries, which amounted to over US \(\$ 170\) billion for the first time. The other countries that were large importers of automotive products in 2013 were Russia (US \(\$ 37\) billion), Australia (US \(\$ 28\) billion) and Saudi Arabia (US \(\$ 23\) billion).

IMPORTS FROM THE MAIN REGIONS FOR AUTOMOTIVE PRODUCTS
(not including intra-regional trade)

\(\qquad\)

\section*{DEFICITS IN AUTOMOTIVE PRODUCTS}

\section*{MAJOR EXPORTING COUNTRIES} OF AUTOMOTIVE PRODUCTS

\section*{SHARE IN EXPORTS FROM THE EU}

TO THE NON-EU - Road vehicles (SITC 78)

to Germany ( \(55 \%\) in 2013), ahead of the United Kingdom (12\%), Italy, Spain and France (at around 5\% each).
France accounted for \(4 \%\) of world exports, worth US \(\$ 52\) billion (inclusive of intra-EU trade), against almost \(8 \%\) in 2004. The United States is still the world's leading importer of automotive products at \(\$ 260\) billion; after its domestic market bounced back, its deficit for automotive products stood at \(\$ 126\) billion, i.e., a level similar to the \(\$ 120\) billion recorded between 2004 and 2006. Chinese imports, up \(6 \%\) to US \(\$ 78\) billion in 2013. Since 2005, Chinese imports have grown by \(25 \%\) per year. China's imports came from the EU-28 ( \(56 \%\) against \(42 \%\) in 2009), followed by Japan (22\% against 36\% in 2009), NAFTA (13\%) and South Korea ( \(7 \%\) ). Reflecting the evolution of their oil
resources, since 2005, the imports of Russia, Saudi Arabia, and the UAE have risen sharply. Saudi Arabia increased its imports by an annual average of \(18 \%\) and the UAE by \(11 \%\). The low level of Italy's domestic market led to a drop in imports, leaving it with a positive balance for automotive sector.

THE EU'S 2013 SURPLUS IN AUTOMOTIVE PRODUCTS

\section*{New passenger car registrations per country}

The Western European market ( 12.1 million new cars, amounting to more than \(90 \%\) of the European market) rose by \(4.8 \%\) in 2014 over 2013, after four years of downward slide. Since 2007, the decrease comes to \(18 \%\), meaning the disappearance of 2.7 million units. For the seventh consecutive year, the market was under 14 million units, representing one fifteenth of the European car fleet. The changes diverge greatly with the geographical area. Northern Europe, including Germany, fell by \(4 \%\) since the pre-crisis level, whereas Southern Europe plummeted by nearly \(50 \%\) (a drop of 2.2 million units). In Southern Europe, the largest declines were in Spain (down 47\%), Italy (down 45\%) and Greece (down 75\%). France is in the middle of the pack, with a decrease of \(15 \%\).
The Northern European markets, including Germany and the United Kingdom, account for nearly two thirds of the European market, whereas they took a little more than half prior to the crisis. Southern Europe's share (Italy, Spain, Portugal and Greece) now come to one fifth of the European market-down from one third prior to the crisis.

\section*{+10 points}

THE RISE IN NORTHERN EUROPE'S SHARE OF THE MARKET FOR NEW PASSENGER CARS IN WESTERN EUROPE SINCE 2007

The West European market covers 17 countries (the 15 European Union countries before 2004 plus Switzerland and Norway). These countries have similar environments and comparable economic conditions. Since 1990, this market has included the former East Germany.
The market has experienced serious crises: in 1993, a decline of \(16 \%\) ( 2.2 million units), and from the last quarter of 2008 , with a decrease of \(8 \%\) (or 1.2 million units). The support policies smoothed demand in 2009. However, while the 1993 crisis hit all Euro-
pean countries, and they all recovered afterward, in the second part of the 1990 s, the 2008 crisis had very contrasted impacts in Northern versus Southern Europe.

\section*{New passenger car registrations per group}

In 2014, the penetration of French manufacturers on the West European market had a 0.5 point lift, after three years of decline, to a share of \(20 \%\). In a highly competitive context, the difficulties of the French and Southern European markets, where they have a strong presence, continue to hit them hard, considering that they now represent just a fifth of the market, compared with a quarter prior to the crisis. French manufacturers rely on their makes, which complement each other.
The Renault Group relies on Renault ( \(7 \%\) market share) and Dacia ( \(2 \%\) ); Dacia amounted to only \(0.5 \%\) of the market in 2007. PSA Group, meanwhile, now includes three makes: PSA, meanwhile, now encompasses three makes: Peugeot (6\%), Citroën (4\%) and, since 2009, DS (1\%). Six major 'generalist' European automakers manufacturing a full line of vehicles held around \(6 \%\) of the market or more. The market shares of Volkswagen and Nissan are increasing.

The Volkswagen Group (VW), with its four main makes, has maintained its position since 1999, and accounts for more than \(\mathbf{2 0 \%}\) of the market. In fact it achieved a new record ( \(25 \%\) ) in 2014, thanks to the rising German economy.
The market share of French groups Renault and PSA Peugeot Citroën (20\% jointly) recovered, but remains below its 2007 level. It was more than \(25 \%\) between 2001 and 2003, the best period in which the French and Southern European markets accounted for \(45 \%\) of the Western European market, compared with \(35 \%\) in 2014. The share of the Dacia make increased, while that of DS is just emerging.
The market share of General Motors (GM) was \(7.1 \%\), representing a 0.7 point decline. GM's Opel took \(6.8 \%\) market share, while Chevrolet dropped to just \(0.3 \%\), reflecting the late 2013 decision to pull out of the European market. In 2014, Ford's market share was \(7.5 \%\). In the mid-1990s, the penetration of these two American groups was around
\(12 \%\) each. Fiat Group now includes the Chrysler makes. The makes of the Fiat Group are now reasonably stable at \(6.1 \%\) penetration; down from nearly \(13 \%\) in 1997 and \(15 \%\) in 1989. In 2014, the Fiat make had a share of \(4.7 \%\). The German groups Daimler and BMW, specialists in premium ranges and corporate sales, undertook a strategy to expand their ranges. Daimler consolidated its growth which began in 1997 by diversifying its range of vehicles, achieving \(5.7 \%\) of the market. BMW, including the Mini, consolidated its position, retaining its high of the year before (6.7\%).
Toyota's market share grew continuously from 1995 to 2007 but dropped thereafter. Since then, it has plateaued at around \(4.3 \%\).
The market share of the Hyundai-Kia Group continued to rise. Its market share (almost non-existent in 1990 and 2.1\% in 2000) was \(5.7 \%\) by 2014.

20\%
SHARE OF NEW PASSENGER CARS SOLD IN WESTERN EUROPE ARE MANUFACTURED BY A FRENCH GROUP

\section*{Range analysis in 2014}

French manufacturers broadened their vehicle ranges over the years, offering around 50 models in 2014, up from 27 in 2000. In the last few years they have also considerably expanded the number of four-wheel drives (C4-Cactus, 2008, Captur, Kadjar) and have refreshed the models for their lower ranges (C1, 108, 308, Clio, Sandero).

Source: CCFA.

The diversity of models available remained broad in 2014; the market shares of the 16 best-selling vehicles in Europe fell to 32\% in 2014, compared with 40\% in 2000. The diversity of the low range from French manufacturers exploded, from eight to around 40 models. In Europe, 72\% of new passenger cars were in the low and low-mid range. The application of tax breaks to more environmentally friendly purchases, as well as a greater variety of the offer have driven the market towards the low range. Following the end of the scrap incentive schemes, this market share declined by more than two points in 2011, but by 2014 it was nearly back to its 2000 level of \(73 \%\).
In the years from 1990 to the early 2000s, buyers tended to trade down from the high-mid range to the low-mid range which offers more MPVs. The market share of sedans, although still dominant, has declined in recent years in favor of station wagons, MPVs, convertibles, light vans and four-wheel drives. However, after 2006, a
dynamic offer in the low range, with a larger number of sedans, caused a reversal of this trend until 2009. In 2014, the "Other" continued category continued to benefit from the expansion of SUVs in the lower-end range (Peugeot 2008, Renault Captur, etc.); it grew by two points and now represents a fifth of the market (compared with \(13 \%\) in 2010).

Each European country retained its own features until 2008 when Southern Europe preferred low- and low-mid range vehicles, while premium cars and station wagons remained the most popular choice in Northern Europe. But in 2009, the success of the low range and sedans, particularly in Germany and the United Kingdom, reduced the contrast between the different regions. This trend has continued from 2010, with the exception of Germany where the upper range regained market share more in line with the long-term structure (35\%).

BEST-SELLING
MODELS IN EUROPE IN 2014 WERE IN THE LOW RANGE

\section*{Technical characteristics of new passenger cars}

The proportion of new diesel-powered cars in Europe as a percentage of total registrations grew significantly between 1997 and 2007, and has now settled to about \(50 \%\). In 2014, it was practically stable at \(53 \%\), just three points less than the 2011 high. In this market of 6.4 million units, French manufacturers' share was \(23 \%\) in 2014 ( \(28 \%\) in 2010), representing about 1.5 million new diesel cars, while it was around \(17 \%\) for all other fuels. This volume of diesel cars represents \(60 \%\) of the total sales of new passenger cars from French manufacturers in Europe 17 countries.

\section*{DIESEL MARKET SHARE PER COUNTRY}

EUROPEAN DIESEL PASSENGER CAR MARKET

Source: CCFA.

\section*{-127 cc}

REDUCTION BETWEEN 2007 AND 2014 IN THE AVERAGE DISPLACEMENT OF NEW PASSENGER CARS IN EUROPE

In Europe, average cylinder capacity and horsepower of car engines differ greatly from country to country. They depend mostly on the economic, tax and geographical conditions of each domestic market. In 2008 and 2009, the slow and regular upward trend toward the highest horsepower stopped, as low range cars gained in popularity. Displacement stopped increasing in 2006 as a result of downsizing (identical engine power with less displacement). Since 2010, these two elements have risen because of the increased share of premium ranges, without however returning to 2008 levels for displacement. The trends continue in 2014: capacity has declined again (by 8 cc ) and horsepower is still on the rise (up by 1 Kw ). The market share of 4WD grew for the fifth consecutive year (up 0.3 point); it stood at \(12 \%\) for the European market as a whole ( 1.5 million units), up from \(8 \%\) in 2009. The vehicle type varies widely from one country to the next depending on national market characteristics. This market share is very high in Switzerland, Norway and Austria, where mountainous terrain has fueled sales of these vehicles. In Germany, it came to \(16 \%\), a small rise over 2013, but it has risen by more than 5 points since 2007.

The market share of diesel vehicles in Europe is largely dependent on local regulations and tax rules. In Europe, in a buoyant market in 2014, the share of sales of diesel cars remained practically stable at \(53 \%\); overall, the volume increase amounted to 280,000 units. In Belgium, France, Ireland, Luxembourg, Portugal and Spain, more than two out of every three new cars registered are still diesel cars. However, the share of diesel rose slightly in Italy ( +1.1 point to \(55 \%\) ) and Germany ( +0.3 point to \(47 \%\) ).
Following a change in tax regulations, Scandinavian countries, in which the percentage of diesel cars was traditionally very low, went on a buying spree to reach high levels by 2012 (around two thirds of the market in Norway and Sweden). However, this figure has since declined by about 9 points.
In terms of passenger cars, diesel vehicle ownership continued to grow, although at a slower rate than for the three previous years, reaching \(40 \%\) in 2014, up by one point.

\section*{Passenger cars in use in Europe}

The number of cars in Western Europe increased \(0.4 \%\) as at January 1, 2014, though that figure includes widely varying figures between the lows observed in Southern European countries and the increases greater than the norm in Northern Europe, with France located just beneath that norm. In the new EU member states and in Turkey, where the rates of vehicle ownership are lower, the economic and financial crisis pounded the pace of growth of car ownership: to nearly \(4 \%\), as opposed to \(5-7 \%\) between 2005 and 2009. The lower-cost demand is still mostly satisfied by imports of used vehicles. In 2013, the new EU member states and Turkey accounted for \(19 \%\) of the number of cars in Europe, as opposed to \(15 \%\) in 2005.
After fluctuating between 32 and \(34 \%\) between 2000 and 2009, the share of cars over ten years old in Western Europe rose for the fifth consecutive year, reaching \(40 \%\), mainly due to the low numbers of new passenger car registrations. Western Europe has become a replacement market. In the new EU member states and Turkey, this share can be estimated at just over 60\%.

IN THE 12 NEW EU MEMBER STATES AND TURKEY

- Cars in use Growth rate: right-hand scale

National sources: statistics organizations, French Transport and Interior Ministries, professional sources. Valid for the entire page.

DIESEL CAR OWNERSHIP IN EU-17

SHARE OF CARS OVER TEN YEARS OLD IN EU-17

On January 1, 2014, the number of passenger cars in use in Western Europe (European Union 15 countries, Switzerland and Norway) stood at 213 million units. The financial and economic crisis amplified the weakened growth of the number of cars in use, nearing that of the population. Declines were seen in all Southern European countries: Spain (- 1\%), Greece (- 0.8\%), Portugal (- 0.4\%), and Italy (- 0.3\%). In France (up 0.2\%), growth was small, while it was higher in the United Kingdom (up 1.4\%) and Germany (up 1.0\%).
After increasing by 2 points per year between 2002 and 2009, the share of diesel cars in Western Europe rose by more than 1 point per year and reached \(40 \%\) on January 1, 2015. In five countries, the diesel engine is the majority: Austria, Belgium, France, Luxembourg, and Spain. On the other hand, this share, although growing, is lower in Germany (30\%) and the

United Kingdom (34\%), although it is slightly above average in Italy (40\%). The new EU countries and Turkey did not behave as a group: The number of vehicles fell in Slovenia (down \(0.2 \%\) ), after remaining stable the year before. There was more expansion in Hungary (up \(1.8 \%\) ), after some improvement in 2012, which followed three years of declines of at least \(1 \%\). In Romania growth was in excess of \(4 \%\), and in Poland 3\%. In Croatia, an EU member country since July 2013, the number of cars increased slightly after a big drop (-5\%) the previous year, but remains close to its 2007 level. Within these new EU member states and Turkey, the percentage of cars with diesel engines is \(28 \%\), up nearly two points per year for several years.

SHARE OF VEHICLES IN USE IN WESTERN EUROPE THAT WERE OVER TEN YEARS OLD IN 2014

\section*{New light commercial vehicles in Europe}

The Western European light commercial vehicle market, severely affected by the 2009 crisis, has since fluctuated around 1.5 million units, which is down around 600,000 units from its record level in 2007. Between 2007 and 2014, the German and United Kingdom markets were slightly lower (by 6,000 and 18,000 vehicles respectively). In the other major markets, the declines in volume vary from 89,000 for France to 162,000 for Spain, encompassing 118,000 for Italy. Southern Europe, including France, now represents 55\% of the European market, up from 42\% in 2007. In 2014, French manufacturers saw their sales advance by \(9 \%\) to 542,000 units, giving them \(36 \%\) of the market. With a presence in every segment and due to the increase of their market share in certain countries (up 3 points in the United Kingdom), French manufacturers were able to maintain their market share at a quite high level, more than 3 points higher than that recorded in 2007.

Light commercial vehicles are defined here as freight carrying vehicles with a gross weight of less than five metric tons. Designed to carry goods, they are offered in a variety of categories, including commercial vehicles derived from passenger cars, light vans, light trucks, large vans, pickups and four-wheel drive vehicles. Since tax conditions are not the same in all European countries, the number of light commercial vehicles as a percentage of total light vehicles ranges from 7\% in Greece to 19\% in Norway. In total, it fell to \(18 \%\) in 2014 . For many years, sales of these vehicles have been stimulated by model renewals and the fact that they offer an appropriate response to business transport and mobility needs. In 2009, the crisis had a severe effect on this market, which had returned to similar levels to those recorded in 1996. In the van segment, French manufacturers maintained their market shares thanks to the success of the

Renault Master, Peugeot Boxer and Citroën Jumper. In the small van segment, competition is stiff, but French manufacturers can rely on a broad offer (Citroën Berlingo and Nemo, Peugeot Partner and Bipper, and Renault Kangoo). In 2014, five of the ten best-selling models are by French manufacturers (Berlingo, Kangoo, Partner, Master and Trafic).
In Spain and Belgium, French manufacturers had a market share of well over \(40 \%\) in 2014. In Germany and Italy, countries with national manufacturers, their share was also up on 2005, in Germany to \(16 \%\) and in Italy to \(24 \%\). France remains the leading European market ( 372,000 units) ahead of the United Kingdom (330,000 units), Germany (234,000 units), Italy (119,000 units) and Spain (114,000 units).

\section*{Heavy truck market and production in Europe}

The European market for heavy trucks weighing more than 5 metric tons contracted by \(9 \%\) in 2014. It stands at 232,000 units, a drop of \(34 \%\) (i.e., 119,000 units) compared to 2008 . Starting in 2003 , the market was in a bullish phase, before plateauing at a record level (more than 350,000 vehicles) in 2007-2008, before plummeting in 2009. Unlike the 1993 crisis, when the market recovered its high levels five years later, the 2009 crisis proved much more long-lasting. European production fell by \(10 \%\) to 380,000 units over the previous year. The serious crisis of 2009 followed five years of high-level stability of the domestic market and the ongoing rise in exports of heavy vehicles outside the European Union ( 15 countries), especially to Eastern Europe and Asia. Since then, there have been wide variations up or down each year. Production is now at the same level as in 2003.

HEAVY TRUCK MARKET AND PRODUCTION IN WESTERN EUROPE

Source: CCFA.

RENAULT TRUCKS' MARKET SHARE IN THE MAIN
EUROPEAN COUNTRIES

NEW HEAVY TRUCK REGISTRATIONS IN EUROPE

RENAULT TRUCKS' MARKET SHARE IN EUROPE

DROP IN NEW HEAVY TRUCK REGISTRATIONS IN WESTERN EUROPE IN 2014

In Europe, after feeling the effects of the recession between 2001 and 2003, in 2008, the heavy truck market reached a record level for the third consecutive year with an increase of \(\mathbf{1 8 \%}\) compared to 2003 , thanks in part to the upturn in spending and in world trade that began in the second half of 2003. On the other hand, it was greatly affected by the effects of the financial and economic crisis of 2009.
Heavy truck investment cycles are relatively long: the high points of 2000, 2006 to 2008 represent \(75 \%\) more than the lowest point of 1993, or nearly 150,000 more vehicles. Compared with the two dark years for heavy trucks-1993 and 2009-the market is finding it harder to pick up since the last crisis than in the nineties; in 2014, five years later, the market is \(12 \%\) larger, compared with 50\% larger in 1998.

Demand continued to focus on the 16 T -and-over segment, which accounted for \(81 \%\) of total registrations, including both trucks and road tractors.
Renault Truck's international expansion was affected by the slump in the Southern European markets. That region's share within Western Europe not including France shrank from 24\% to \(13 \%\) between 2007 and 2014. Renault Truck's penetration outside France, amounting to \(3 \%\), is also down compared with what it was in 2008 (6\%). Overall, registrations of Renault Trucks have fallen, and its market share in Europe stands at \(8 \%\).

\section*{French manufacturers in the new EU member states}

In 2014, production of vehicles expanded (up by \(6.4 \%\) to 3.6 million vehicles) and established a new record above of those of the two previous years. Sales of new vehicles grew by \(13 \%\), to one million units. The difference between production and sales of new vehicles was therefore 2.6 million units. The local new vehicle market is notably lower than its 2007 level (down by \(33 \%\) ). French manufacturers have had a commercial presence in this region for a number of years, and also have local production plants: PSA Peugeot Citroën in Slovakia; Toyota in the Czech Republic; Renault in Slovenia and Romania via the acquisition of auto manufacturer Dacia. The companies' presence in these countries favors sales there, and those are expected to rise, given the low ownership levels (i.e., numbers of vehicles per 1,000 inhabitants), compared with those in France or Germany.

15.

SOLD IN THE MAJOR NEW EU COUNTRIES IS MANUFACTURED BY A FRENCH GROUP

Although the EU-15 is dominated by replacement demand, this is not the case in new and future member states and neighboring countries, where the potential for first-time car ownership is significantly higher. Central and Eastern European Countries (CEEC) produced 3.6 million vehicles in 2014. Their activity progressed just like that of Western Europe after the recovery of the European market.
In 2014, production was higher for the sixth year in a row, thanks to the domestic demand of the region, this being defined as the sum of new vehicle registrations plus imports of used vehicles. This imbalance has lasted since the 2009 crisis.
In 2014, new vehicle sales recovered to one million units, after remaining stable the previous year. Sales increased in all the countries and more sharply, with the exception of

Slovakia, in those countries that showed a decline in 2013 (Croatia, Romania and the Czech Republic).

\section*{The automotive industry in the European Union}

In 2012, The European automotive industry employed 2.3 million people, \(45 \%\) of whom worked in vehicle manufacture. Since 2005, on an equivalent scale, the numbers employed have developed differently, depending on the part of the continent: declining in Western Europe by 270,000 (about equivalent to the previous year), while increasing in the new EU member states by 110,000. Value added per employee ranged from \(€ 30,000\) a year in the six main new EU member states to \(€ 94,000\) in Germany. In France, this figure was \(€ 51,000\), below the European average of \(€ 66,000\), as a result of the low level of output. Per capita personnel costs ranged from \(€ 15,000\) in the six main new EU member states to \(€ 70,000\) in Germany, a ratio of around one to five; in France they were \(€ 54,000\), above the European average of \(€ 47,000\).

VALUE ADDED PER EMPLOYEE EXPRESSED IN THOUSANDS OF EURO
( \(\mathrm{I} € €\) thousands)

PERSONNEL COSTS PER EMPLOYEE

(1) Since 2008, data has been published in a classification of new economic activity involving in particular a change to the scope of the automotive industry (inclusion of manufacture of electrical and electronic equipment). (2) 6 main new EU member states: Hungary, Poland, Czech Republic, Slovakia and Slovenia: body and trailer manufacturing employees are included in the figures for vehicle manufacturers.

The automotive industry, one of the key industries
of the European economy, includes:
- automobile manufacturing;
- body and trailer manufacturing;
- automotive equipment manufacturing.

The data in the above table come from surveys of national companies and have been adjusted for consistency by Eurostat. Due to difficulties in collecting and standardizing statistics at both the national and European level, only data up to 2012 were available. Germany accounted for \(35 \%\) of the total employees in the automotive industry. France represented \(11 \%\), against an average of around 6\% for Spain, Italy and the United Kingdom. The people employed in the
six new member countries (Hungary, Poland, Czech Republic, Romania, Slovakia and Slovenia) reached \(25 \%\). The automotive industries differed significantly from country to country in terms of structure and wages.
In Germany and Sweden, the percentage of employees in the industry involved in automotive manufacturing was higher than \(60 \%\), while in France it was \(56 \%\), as opposed to \(24 \%\) in the six main new EU member states. It was between 37\% and \(50 \%\) in Italy, Spain and the United Kingdom. The share of employer social contributions in personnel costs stood at \(30 \%\) in France, compared to \(17 \%\) in Germany, while the average for Europe stood at around \(22 \%\).

THE FALL IN STAFF NUMBERS IN THE AUTOMOTIVE INDUSTRY IN WESTERN EUROPE FROM 2005 TO 2012

\section*{French automobile manufacturers in 2014}

PSA Peugeot Citroën: www.psa.fr
In 2014, in a context of growth in the world market and of mild recovery in the base market compared with a low level, PSA Peugeot Citroën Group sales rose by 4.3\%. The best growth was in Europe (8\%), where the Group still holds second place (for passenger cars and light commercial vehicles). Outside that region, the company achieved record sales in China (734,000 units). The Group's commitment to international expansion is based mainly on long-term, targeted cooperation initiatives with other automobile manufacturers. In China, the Group works with Dongfeng Motor, with which it is developing a strategic partnership and plans to build a fourth factory, and with China Changan Automobile Group. PSA and General Motors continue their cooperation in Europe with the aim of developing two vehicles on common platforms and a new model of light utility vehicle on the basis of PSA platforms.
The PSA Peugeot Citroën Group has a workforce of around 190,000 employees worldwide, including 84,000 in France, working at around twenty sites (assembly plants, plants for manufacturing engines and mechanical systems, R\&D centers, head office, etc.). In addition to the assembly plants (cf. opposite), the Group has a number of large sites in France, such as Vélizy (R\&D), Trémery (engines), Vesoul (spare parts warehouse) and Valenciennes (gearboxes), which employ several thousand people. In technology, the Group has three priority goals: develop technologies that reduce consumption and polluting emissions (the car using 2 liters to go 100 km , hybrid models); the self-driving connected vehicle (introduction of delegated driving); and the technology serving the attractiveness of the brands.
In 2014, the Group launched the "Back in the race" plan, which shoots for four objectives: Peugeot, Citroën and DS, three brands recognized world-wide; a concentrated global product plan; profitable growth on the international scene; and modernization in order to improve competitiveness, particularly in Europe.
In 2013, a new structure was planned to be implemented starting in 2014 so as to take part in the turnaround of the company and to maintain the Group's technological and industrial bases in France.

Renault: www.renault.com
Renault's worldwide sales increased by \(3.2 \%\) due to the recovery of the European market. The Renault make is ranked third in the European light vehicle market. Sales outside Europe represented \(46 \%\) of sales, compared with \(50 \%\) the year before, due to the slowdown in the emerging markets. As time has gone by, the cooperation started in 1999 with Nissan in the
scope of the Alliance has become optimized and new synergies (in terms of production, as well as electric vehicles) have been introduced. In 2014, the Alliance began four convergence projects in key functions: engineering (products and technology); assembly and logistics; purchasing; and human resources. In 2010, the Group also strengthened its alliance strategy by signing an agreement with Daimler AG for small cars, light commercial vehicles, and engines (including low-emission models since 2012). The strategic partnership with AvtoVAZ, extended to Nissan, with an increased shareholding in 2014, aims to speed up their growth and strengthen their presence in Russia. Renault has four lines of development for the vehicle of tomorrow: safety; well-being on board (delegation of driving); reduction of environmental impact (the car going 100 km on 2 liters of fuel, the selfdriving car, zero emissions); and mobility accessible to all.
The Renault Group has a workforce of around 117,000 employees worldwide, including 46,000 in France, working at around fifteen sites (assembly plants, plants for manufacturing engines and mechanical systems, R\&D centers, head office, etc.). Large numbers of employees may work outside of assembly sites.
In 2011, Renault launched a new strategic plan "Renault 2016 - Drive the change" which addresses two goals: group growth and generation of free cash flow by 2016. The major initiatives in the 2014-2016 period concern updating the range, expanding internationally and renewed ambition for Europe, enhancing our competitiveness, increasing our synergies with the Alliance and reining in capital expenditure. In 2013, the group planned a reorganization to maintain the sites in France and expand their activity.

Renault Trucks: www.renault-trucks.com
Renault Trucks continued to suffer from the weakness of the European market (down 10\%), and especially the weakness of the markets in Southern Europe where it has a solid base. It had \(8 \%\) market share in Western Europe. Since 2009, Renault Trucks has been using new assembly sites outside Western Europe. It has a partnership with Volvo in Russia and also has interests in four other countries: Morocco, South Africa, Uruguay and Iraq. Within the AB Volvo Group, which has more than 90,000 employees world-wide, Renault Trucks employs 9,000 people in France (activities such as assembly, production of mechanical systems in Vénissieux, research in Saint-Priest, etc.). Beyond industrial cooperation, synergies among the Group's five makes (Renault, Volvo, Mack, UD Trucks and Eicher) continue to play out. Application of the Euro VI standard early in 2013 led to the complete overhaul and simplification of the entire range, which should translate into gains in market share.

\section*{Markets for new French vehicles}

In 2014, the domestic opportunities for French manufacturers and sales outside of France grew by 4\% each, after two down years. French manufacturers' market share in their markets rose to \(21 \%\) ( \(19 \%\) for passenger cars, \(27 \%\) for light commercial vehicles and \(32 \%\) for heavy trucks). Export markets represented \(79 \%\) of the French automobile manufacturers' sales, compared with two-thirds in 2000 and less than 60\% in 1990.
Exports outside the European Union in 2014 stood at around \(55 \%\) of the total markets of French manufacturers, just a little higher than in 2010. The recovery of the Southern European markets and the decline in some emerging markets led to a 4-point drop in this ratio. In total, it fell to \(30 \%\) in 2000.

\section*{New heavy trucks over 5 metric tons}

\section*{New heavy trucks over 5 metric tons}

New heavy trucks over 5 metric tons

(1) Starting in 2012, the scope of heavy trucks includes invoices for 7 metric tons and greater (see note page 77).

From 1997 to 2001, registrations of vehicles from French manufacturers in France had increased due to an available range that was not only rich in new models, but also high-powered and affordable. The cycle reversed in the period 2002-2007. Tougher competition followed by a selective sales strategy applied by French manufacturers have prevented them from consolidating these gains. In 2008, the rise in volumes sold can be explained by the dynamic commercial vehicle market and the offer from French manufacturers that was rich in models with low \(\mathrm{CO}_{2}\) emissions in line with the "incentive/penalty" ("bonus/malus") system. In 2009 and 2010, this ecoscheme associated with the scrap incentive program sup-
ported general car sales and particularly those of French groups adapted to the offer. From 2011 to 2013, before the slight recovery of 2014, the end of the scrap incentive system led to falling sales, specifically for French manufacturers. Piror to that, the impact of the crisis in the countries in which they had a major presence impacted their exports of passenger cars outside France. French passenger car exports reached 4.0 million units in 2014, a rise of \(3 \%\). Exports of light commercial vehicles increased again, climbing \(8 \%\) to 554,000 units, whereas exports of heavy trucks plummeted by \(8 \%\) to 17,000 units.

SHARE OF THE FRENCH MARKET IN MARKETS FOR FRENCH MANUFACTURERS

\section*{Competitive factors in the French automotive industry}

In a highly competitive global market, French automobile manufacturers must be efficient and deal with issues that the whole industry is facing. These include the burden of mandatory levies on the factors of production and the exchange rate, as well as other issues that are unique to the automotive industry, such as the opening of the base market to competition... All these issues impact the margin rates (the ratio of gross operating surplus to value added). Margin size has an impact on the financing of investment and the improvement of companies' competitive position. Several reports in recent years, including the "Pact for the competitiveness of French industry" (2012), had demonstrated the sustained weakness of margins of French industry compared with other eurozone countries. This Pact led the government to draw up a "National pact for growth, competitiveness and employment", which, among other things, created the Competitiveness and Employment Tax Credit (Crédit d'Impôt Compétitivité et Emploi - CICE), for a total amount of €20 billion, based on the salary basis excluding salaries that are higher than 2.5 times the index-linked minimum growth wage (SMIC). Since the average wage in this industry,

LABOR COSTS IN THE MANUFACTURING INDUSTRY

of labor costs.

Source: Eurostat.

LABOR COSTS IN THE MANUFACTURING INDUSTRY
Results of the four-yearly ECMOSS surveys and extrapolation using quarterly indices of labor costs (Index \(100=2008\), according to annual averages).

MARGIN RATE (GOS/VA) AND INVESTMENT RATE (GFCF/GOS) OF THE AUTOMOTIVE INDUSTRY

The margin rate is the ratio of the gross operating surplus to the value added before tax, and the investment
rate is the ratio of gross fixed capital formation to value added, before tax.
Source: INSEE (national account, base 2010).

\section*{10 POINTS}

THE DIFFERENCE BETWEEN FRANCE AND GERMANY FOR HOURLY LABOR COSTS IN MANUFACTURING BETWEEN 2000 AND 2014, TO FRANCE'S DISADVANTAGE

Competitiveness is defined as an industry's ability to withstand competition and expand in markets. It is relative, in that it is determined in comparison with the other market operators.
To continue to grow, the French car industry must guarantee performance comparable to that of its European, American, Japanese, Korean and in the future, Chinese, even Indian competitors. Margin rate (operating income/ sales) is one of the tools that can be used to measure this performance of automotive groups. In 2014, it stood at \(3.9 \%\) for Renault and \(1.7 \%\) for PSA. And yet, the margin rate of the German groups stood at \(6.3 \%\) for Volkswagen, \(11.3 \%\) for BMW and 8.3\% for Daimler. In a European context that lost more than 4 million light vehicles (passenger cars and light commercial vehicles) between 2007 and 2014, the
performance of European general manufacturers was not profitable; they suffered losses before turning around in 2014. Beyond the problems of globalized competition and industry (payroll, social and tax costs), there are competitive factors specific to the French automotive industry, resulting from the properties of the vehicles themselves and of the global automobile industry.
One of the factors affecting the French industry is the weight of social security contributions in the job factor. In France, it is one of the highest in the European Union including the eurozone. It is higher than the United Kingdom, Italy, Spain, etc. and much higher than costs in Eastern Europe. However, mandatory levies on the factors of production affect automotive manufacturing directly and indirectly through the chain of supply.
> COMPETITIVENESS
which is exposed to international competition, is higher than the CICE ceiling (still more in the automobile industry); the industry obtains only a \(20 \%\) benefit. Implementation of the Responsibility Pact starting in 2015 , providing for a lowering of the contributions made by employers as well as taxation, should help level out this discrepancy that France has.
The prices of raw materials in euro have increased hugely since 2001, yet it is difficult to pass on such price hikes to consumers in the current climate of stiff competition. This is particularly the case in so-called developed countries in light of the multiple trade-offs made by households in terms of consumption.
Nonetheless, raw materials prices have declined relative to 2010 . At the start of 2015 , oil seemed to be down by \(28 \%\), rubber had fallen \(51 \%\), and steel by just \(8 \%\).
Last, in terms of freight transport by road, more than one public opinion indicator give encouraging signals for 2015 which, if they come to pass, could stimulate purchases of both light commercial vehicles and heavy trucks.

SHARE OF EXPORTS BY FRENCH MANUFACTURES OUTSIDE THE EUROZONE (12 COUNTRIES)

Furthermore, the exchange rate can significantly alter trade terms because of the increasingly large share of production outside of the eurozone.
Since early 2002, the rise of the euro has affected French exports, forcing companies to bolster their sales and production initiatives in order to continue to expand their markets outside the eurozone (70\% of total markets in 2014, compared with \(47 \%\) in 2002).
On the other hand, there are factors associated with opening up the market, whether internal or external. In general, the internal "base market" acts as a strong foundation for using international development and innovation to drive growth in foreign markets. The French automotive industry's base market is its domestic and especially European market where there is open competition and where non-Euro-
pean manufacturers have a significant and steadily growing share. In other auto-making countries, such as Japan or South Korea, market access is more difficult and local manufacturers therefore have a broader base market from which to develop internationally. This has resulted in trade asymmetry between these two countries and the European Union.

70\%
SHARE OF NON-
EUROZONE IN FRENCH MANUFACTURERS' EXTERNAL SALES (ALL VEHICLES)

\section*{Consolidation of the automotive industry}

Registrations of new light vehicles (passenger cars and light commercial vehicles) in Western Europe stood at 13.6 million units in 2014 against 16.9 million in 2007, which is a reduction of \(20 \%\). This collapse of the markets can be seen in the industrial production index of the French automotive industry measured by the INSEE (base 100 in 2010) which fell from 146 in 2005 to 91 in 2014. The automotive industry restructured to deal with such a major crisis. The Plateforme de la Filière Automobile (PFA - Automotive Branch Platform) was set up in 2009 by French automobile manufacturers and their suppliers, who joined to form the Comité de Liaison des Fournisseurs de l'Automobile (CLIFA Automotive Suppliers' Liaison Committee), which aimed to improve the effectiveness of the automotive industry. In the context of the Conseil National de I'Industrie (CNI - National Industry Council), the Comité Stratégique de Filière de l'Automobile (CSFA - Strategic Committee of the Automotive Branch) was created. The CSFA brings together the entire industry, upstream and downstream, including employees unions.

INDUSTRIAL PRODUCTION INDEX
(Base 100 in 2010)

The economic and financial crisis had significant effects on the automotive sector, upstream starting with the suppliers and downstream as far as vehicle sales/maintenance, including freight transport, manufacturers of equipment and services for companies, including research and development. The fabric has weakened, and in order to address this context, the PFA, which is the responsible party, has established four priorities: lean manufacturing, future skills and jobs, better management of communication, and the medium- and long-term strategy for the competitiveness of manufacturers and their suppliers. Since 2010, it has relied on a regional level on the Associations Régionales de I'Industrie Automobile (ARIA - Regional Associations of the Automotive Industry). Following an initial active phase, it consolidated in 2012, mainly around the Comité Technique Automobile (CTA - Automotive Technical Committee), the Comité de Standardisation Technique Automobile (CSTA - Automotive Technical Standardization Committee) and the Comité de Recherche Automobile (CRA - Automotive Research Committee). The purpose of the CTA is to provide a common vision for the automotive industry in terms of research and innovation. Some of its research programs (e.g., a car that consumes just 2 liters every 100 km , a driverless car and installation of electric charging stations on streets) are associated with many plans included in the "New industrial France" policy launched by the government in September 2013. A second phase of the policy will be launched in 2015 with nine industrial solutions, including ecological mobility. The PFA is also a member of the CSFA.
The CSFA was created in 2010, together with ten other Strategic Branch Committees, following the Etats Généraux de l'Industrie (EGI - Industry Summit) held the same year. It includes automobile and heavy truck manufacturers with a presence in France, "Tier 1" equipment manufacturers and a large number of SMEs and temporary employment agencies which supply the automotive industry and belong to various sectors (mechanical systems, plastics, stamping, foundries, etc.). Bodybuilders and the downstream side of the branch (distribution, repairs) are also included, as are players in R\&D, in particular competitiveness clusters and major public research bodies (IFPEN, IFSTTAR). Branch employee unions also participate. In October 2012, a sector contract was signed that defined four working areas: a common vision in
the branch for anticipating economic changes, innovation and R\&D, solidarity of the branch and player globalization. In 2014, some objectives of the contract have already been fulfilled, such as defining the priority paths for research and development (relying on the work done by the CTA) and the extension of the FMEA for three additional years (see opposite page). CSF's 2015 priorities will concern bringing forward and speeding up R\&D work, developing the players and collaboration within the industry.

\section*{2009}

YEAR IN WHICH THE PLATEFORME DE LA FILIĖRE AUTOMOBILE (AUTOMOTIVE BRANCH PLATFORM - PFA) WAS CREATED

\title{
Intervention Funds, Research Tax Credits, Future Investments
}

The automotive industry requires considerable physical investments (production sites, etc.), which are paid off over long periods. In addition, during their design and before they are sold, vehicles require work in research centers lasting several years, in a process of permanent progress, in order to be able to meet the needs of society in terms of safety as well as the environment. The automotive industry is a capital-intensive industry which, in general terms, has considerable financing needs. During the financial crisis, this specific feature had a serious effect on the automotive industry, and the public authorities created structural instruments to encourage long-term financing (Strategic Investment Funds in 2008 and a Fund for Modernizing Automotive Equipment Manufacturers in 2009, which were both rolled up into Bpifrance in 2013) and research and development capabilities (Research Tax Credit and Future Investments). In all, the FSI and the FMEA provided nearly \(€ 400\) million to companies. In 2015, the FMEA amended its strategy to support the ambitious members of the industry that had external expansion and growth plans, and became the Fonds Avenir Automobile (the Automobile Future Fund).

INVESTMENT FUNDS
\begin{tabular}{|c|c|c|}
\hline & \multicolumn{2}{|r|}{Goals and provisions List of recipients} \\
\hline \begin{tabular}{l}
Strategic investment fund (FSI) (2008-2013) \\
Bpifrance Mid \& Large Cap (since 2013)
\end{tabular} & At the outset: Sovereign wealth fund set up by the public authorities to meet the equity capital needs of companies with potential for growth and competitiveness for the economy. At the end of 2014, the capital was in excess of fifteen billion euro. & Gruau, Mécachrome, Valéo \\
\hline Fund for the modernization of automotive equipment manufacturers Tier 1 (FMEA Tier 1) (2009-2014) & To take minority holdings in companies working in the automotive branch which are undertaking industrial projects that create value and competitiveness for the economy. Total investments come to between five and sixty million euro. Initial provision of \(€ 600\) million equally distributed among PSA Peugeot Citroën, Renault SA and the FSI (which is now Bpifrance). & Agrati, Atelier des Janves, Bourbon, Cooper Standard France*, Defta, Delfingen, Electropoli*, Faurecia AC, FSD SNOP, Maike Automotive, Mecaplast, Metaltemple, Michel Thierry*, SAFE, Saint-Jean Industries, Savoy International*, Sofedit / Gestamp, Sora*, Trèves \\
\hline Fund for the modernization of automotive equipment manufacturers Tier 2 (FMEA Tier 2) (2009-2014) & Fund specifically aimed at smaller automotive suppliers (Tier 2 and higher). Total investments come to between \(€ 1\) and 5 million. Initial provision of \(€ 50\) million. The funds arise out of the FAA (Renault, PSA, Bpifrance) and the large Tier-1 equipment makers: Valeo, Faurecia, Plastic Omnium, Hutchinson and Bosch. & Adduxi, Altia, Citèle, Devillé, Embaltech*, FMX, Maike Automotive, PJ Industry, Saint-Jean Engine*, SPPP, Tecma \\
\hline Fonds Avenir Automobile (FAA) (since 2015) & Support for profitable companies in the automotive industry that have plans to consolidate their industry positively, to start operations abroad, to diversify their customer base or to expand their capital, as well as companies with new technologies aimed at the automobile of the future. Acquisition of minority equity stakes for unit amounts of between one and fifty million euro. The funds invested come from Renault, PSA and Bpifrance. & See above. \\
\hline Fonds Avenir Automobile Tier 2 (FAA Tier 2) (since 2015) & Fund specifically aimed at smaller automotive suppliers (Tier 2 and higher) Total investments come to between \(€ 1\) and 5 million. The funds arise out of the FAA (Renault, PSA, Bpifrance) and the large Tier-1 equipment makers: Valeo, Faurecia, Plastic Omnium, Hutchinson and Bosch. & See above. \\
\hline
\end{tabular}
* Companies taken out of the portfolio at the end of 2014

Source: Bpifrance.

In connection with long-term financing, since it was created the Strategic Investment Fund (FSI), now Bpifrance Participations since the public investment bank Bpifrance was created, had invested in three companies in the automotive sector. As for the Fund for the modernization of automotive equipment manufacturers tier 1 (FMEA Tier 1) to which French manufacturers contributed \(€ 400\) million in addition to the more than \(€ 200\) million contributed by the FSI , it has invested \(€ 330\) million in 19 equipment manufacturing companies. The Funds for the Modernization of Automotive Equipment Manufacturers Level 2 (FMEA Level 2) in turn has contributed \(€ 23\) million to eleven companies.
Future investments were launched at the end of 2009 after the Juppé-Rocard report recommended boosting innovation in France. The objective of this 47 billion euro investment program ( 35 billion in 2010, then 12 billion more in 2013), is to strengthen productivity and improve the competitive edge of French companies. The \(€ 1,150\) million dedicated to the automotive sector concern financing for projects concerning the vehicle of the future which must be more economical and more efficient in environmental terms.
The automotive industry also benefits from sections which it can access among the other future investment programs, including a project relating to the creation of an internationally oriented "Institute for Excellence in Carbon-Free Energy" named "Véhicule Décarboné Communicant et sa Mobilité" (VeDeCoM - Communicating Carbon-Free Vehicle and its Mobility). VeDeCom is based on a single site in the Yvelines and is set to become a reference in the new eco-mobility branch. It has three areas for research: electric vehicles, driving delegation and connectivity, and shared mobility and energy. It includes over 40 members: large industrial groups including PSA and Renault, SMEs, research laboratories and centers, colleges and training centers, as well as local authorities. The planned 10 -year budget is around \(€ 300\) million, a third of which is financed by the manufacturing companies.
French automakers are also members of the Jules Verne Technological Research

Institute (IRT) at Nantes. The 10-year budget is of the order of \(€ 350\) million, partially funded by "future investments." It specializes in advanced production technologies for composite, metal and hybrid structures. It focuses on the transportation equipment, including the car, as well as energy.
The public authorities also support Research and Development in companies through the Research Tax Credits (CIR), a fiscal measure created in 1983, improved in 2004 but simplified and amplified by the 2008 Finance Act. In 2012, the manufacturing industry received \(60 \%\) of the total Research Tax Credits, representing \(€ 5.3\) billion. The automotive industry was the third highest recipient of Research Tax Credits, representing \(6.5 \%\), or \(€ 344\) million.
Loans from the European Investment Bank (EIB) and the Framework Program for Research and Technological Development (PCRD) of the European Union also make it possible to guarantee effective stimulation of funding for R\&D. Nevertheless, in the European Union as a whole, the automotive industry accounts for one quarter of all private R\&D, twice as much as aeronautics, while receiving five times less assistance. Moreover, countries that have traditionally been strong in the automotive industry as well as the BRIC countries are also providing major support for the automotive branch, in particular in terms of R\&D.

\section*{IN 19 EQUIPMENT MANUFACTURING COMPANIES: MAGNITUDE OF INVESTMENT BY FMEA TIER 1 (NOW THE FAA) IN THE AUTOMOTIVE INDUSTRY AT THE END OF 2014}

\section*{The Automotive industry in France's regions}

If we count direct jobs (production and research sites of manufacturers), indirect jobs (supplier sites) and induced jobs (generated by the business of the former), the automotive economy is often a mainstay of local economies.

\hline
\end{tabular}

The INSEE Outlook Report of March 2012 shows that one unit of value added in the automotive sector generates 4.1 units of value added in the national economy. The automotive industry has the highest value added multiplier after the aviation and space industry. In addition, industrial sites generate local economic activity that is not limited exclusively to their own employees (direct employment). Regional divisions of the INSEE have produced papers describing, on the one hand, indirect jobs made up of personnel employed by suppliers, sub-contractors and service providers and, on the other hand, induced jobs, which are those that are required to fulfill the consumption needs of employees (direct and indirect) and their families. The DGE (2015) produced a study on the automotive industry (cf. page 58) that describes the sector by way of a core and a periphery. The core activities (manufacturers, equipment makers, body builders) require products or industrial services to be produced, which illustrate INSEE's multiplicator effect.
The 2012 study by the INSEE Haute-Normandie shows that the automotive industry employed 27,000 people in the region in 2010 , of which 8,000 were in manufacturing and 19,000 were in the rest of the branch, including \(48 \%\) in equipment manufacturers, \(30 \%\) in the production of intermediate goods and \(9 \%\) in design and analysis. Studies by the INSEE Nord-Pas-de-Calais from February 2014 indicate that the automotive industry had 36,000 employees in 2011, including 19,000 in automotive manufacturing. Moreover, in this region, more than \(40 \%\) of the employees in the plastics sector and almost one quarter of workers in the metalworking industry are dedicated to the automotive branch. The 2009 study relating to the south of Alsace and the north of Franche-Comté highlighted that in 2008 45,000 people overall (spouses, children) depended on the activity of the 13,000 people employed directly or indirectly by the automotive industry. Also, the studies con-
ducted in 2008 relating to the Seine-Aval region indicated that one in six jobs depended on the activity of the PSA Peugeot Citroën and Renault plants in the area, specifically the Poissy and Flins sites, respectively. The ratio of employees to temporary workers on these sites is 5 to 1.
The Associations Régionales de I'Industrie Automobile (Regional Associations of the Automotive Industry - ARIA), regional representatives of the Plateforme de la Filière Automobile (PFA), bring companies (manufacturers, equipment manufacturers and other suppliers) of the automotive branch in the regions together with the public authorities and education and research establishments. There are 15 of these. They perform various tasks: increasing competitiveness, improving industrial performance, access to new opportunities (customers and markets), emergence of new projects, promotion of the image of the sector in the regions. They also cooperate with automotive competitiveness clusters. Furthermore, each ARIA organizes the Regional automotive operating committee which brings together the Public Authorities (DIRECCTE and the leading automotive company in the region, credit intermediary, OSEO, Caisse des Dépôts et Consignations), the UIMM and other professional bodies, as well as the competitiveness clusters.

OF VALUE ADDED IN THE NATIONAL ECONOMY GENERATED FOR EACH UNIT OF VALUE ADDED IN THE AUTOMOTIVE SECTOR

\section*{Economic ratios of the automotive industry in France}

As a crossroads between many different technologies, the automotive industry needs considerable investments. Automotive manufacturing has been reinvesting almost \(3 \%\) of its total revenues since the start of the crisis in late 2009. In a new scope of the industry (now including extractive industries, food industries and industrial companies with fewer than 20 employees), the automotive industry represented \(5 \%\) of the gross fixed investments exclusive of contributions in 2011, compared with \(7 \%\) in 2009.
To address new social demands (the environment, road safety, etc.), the automotive industry is investing more in intangibles and R\&D (see the next few pages) for which "automotive" competitiveness clusters are particularly appropriate.

DOMESTIC AND EXPORT SALES BY THE AUTOMOTIVE
MANUFACTURING INDUSTRY \({ }^{(1)}\)

(1) CCFA estimates for 2013: see also pages 80 and 81 (in particular for concept changes).

Every year, INSEE conducts surveys of French companies, providing a primary source of information about French industry. This survey was previously performed by the statistics office of the French State Secretariat for Industry (SESSI). These surveys have been overhauled with the new ESANE information system. A new economic activity categorization was launched in early 2008 (see pages 80 and 81). The automotive industry covers motor vehicle manufacturing; motor vehicle, caravan and recreational vehicle body manufacturing; and the upstream manufacturing of automotive equipment. However, the statistics do not encompass all automotive industry suppliers. Products such as tires, plastics, capital goods and glass are classified under other categories (see also page 59).

\section*{Automotive manufacturing}

Following strong growth between 1996 and 2004 (+ 30\%), in line with the increase in vehicle production, value added (excluding tax) of automotive manufacturing, in constant euro and by employee, has fallen under the impact of various factors: expenses linked to new environmental standards, stagnation and then collapse of the Western European market for new vehicles worsened

CAPITAL EXPENDITURE BY THE AUTOMOTIVE MANUFACTURING INDUSTRY \({ }^{(1)}\)

by the crisis, and the rising cost of raw materials. In 2014, the rise enabled it to be \(€ 17\) higher than its 2009 level. The automotive manufacturing industry dedicated almost \(3 \%\) of sales to capital expenditure representing nearly \(€ 2\) billion to develop new models and optimize its production capacity. These figures do not include research and development costs (see page 34). The share of export sales has increased constantly since 1990, when it reached \(38 \%\), now oscillating around \(60 \%\), compared with \(35 \%\) for the whole of the manufacturing industry.
2.7\%

AVERAGE OF THE SHARE
OF SALES DEVOTED TO INVESTMENT INTO AUTOMOTIVE CONSTRUCTION

\section*{Research and development expenditure in the automotive sector}

In 2012, the French automobile industry remained the leader of all other industries in France in terms of corporate research and development spending. Its expenditure was \(€ 5.9\) billion, accounting for \(15 \%\) of total corporate spending on research and development. After rising strongly between 2001 and 2006 (+ 24\%), R\&D expenditure in the automotive industry reached a plateau of around \(€ 4\) billion before growing again in 2008 (+ 10\%). After 2009, the crisis significantly limited the financial resources, but expenditure only fell by \(2 \%\) in 2009 and 2010, stressing its vital, long-term nature. It made a strong recovery (+ 11\%) reaching a record level in 2011, before falling in 2012 (down \(5 \%\) ). It represents \(47 \%\) of the gross value added in the sector. The automobile leverages a wide variety of technologies and therefore requires significant research initiatives to ensure its reliability throughout its lifetime, user safety and environmental protection; this is even more significant with the transition from the Euro 5 to the Euro 6 standard. The automotive industry's R\&D budgets exceeded those of the pharmaceutical industry and the aviation and space industry.

TOTAL CORPORATE RESEARCH AND DEVELOPMENT EXPENDITURE IN FRANCE IN 2012 IN THE MAIN RESEARCH SEGMENTS

AUTOMOTIVE INDUSTRY RESEARCH
AND DEVELOPMENT SPENDING

The Office for research-related statistics of the French Ministry of Education carries out surveys on research and development (R\&D) spending by companies and in the wider public sphere. The total R\&D budget is broken down into domestic spending, which covers work performed in France, regardless of the origin of funding, and external spending, corresponding to work performed by other companies or public research organizations. A portion of the latter work may be performed outside of France. From 2008, data are published in a new economic category. Since 1999, the leading R\&D segment in France has been the automotive industry, except in 2007 when it was ranked second. Since the 2008 crisis, the industry has invested more than \(€ 23\) billion into it. The R\&D segment in France stimulates its suppliers such as the plastics and electronics industries. In 2012, \(25 \%\) of domestic R\&D spending in the automobile industry was performed by subsidiaries in which foreign companies had a controlling interest of \(50 \%\) or more. In 2012, 33,000 equivalent full-time employees (including 18,200 researchers) worked in automotive R\&D. These figures were
up \(1 \%\) compared to 2003 (+ \(32 \%\) for researchers). According to the French National Industrial Property Institute (INPI), PSA Peugeot Citroën Automobiles (including Faurecia) and Renault were among the largest patent applicants with the INPI in 2014. France also has three major equipment manufacturers in the top twenty. The automotive industry still files more patents than any other industry.

SHARE OF THE AUTOMOTIVE INDUSTRY IN THE TOTAL RESEARCH AND DEVELOPMENT BUDGET OF COMPANIES IN 2012

\section*{Automotive competitiveness clusters in France}

Set up by the government and local authorities in 2005, these competitiveness clusters bring together companies (small and mid-sized), research units and training centers to work on collaborative projects. They also offer many services: business intelligence, assistance for filing patents, networking, etc. Their role is to boost the competitive nature of the French economy by highlighting its capacity for innovation and encouraging the structure and proximity of the different regions.
The "National pact for growth, competitiveness and employment", drawn up by the French government in November 2012 had aimed to concentrate the action of competitiveness clusters towards the products and services to be manufactured in order to increase their economic impact in terms of the growth of companies and job creation. This new phase came into effect with the performance contracts for 2013-2018.

In 2014, the automotive industry continued its research and development throughout its clusters. Within them, it worked to respond to the challenges of industrial excellence and sustainable mobility. This transverse action brings together automakers, equipment manufacturers, innovative small and midsized companies, research laboratories and training organizations including universities.
The internationally oriented Mov'eo cluster (www.pole-moveo.org) covers the greater Paris region (Ile-de-France), Lower Normandy and Upper Normandy regions. Mov'eo has the main aim of federating projects dealing with the optimization of mobility. The following themes were addressed: consumption, the environment, road safety, mobility and services, and mechatronics. In 2014, efforts were focused mainly on cooperation with the other competitiveness clusters, including those outside the automotive industry, and on the "Institute for Excellence in Carbon-Free Energy" VeDeCoM which was officially launched. The measures specified in the new performance contract are in place. The cluster is also involved in six of the 34 "industrial revitalization plans" launched by the government in September 2013: cars that consume less than 2 liters per 100 kilometers, electric charging stations, battery autonomy and power, self-driving cars, recycling and green materials, and the "factory of the future."
The Véhicule du Futur cluster (www.vehiculedufutur.com) draws on the traditional catchment areas of the automotive industry, Alsace and FrancheComté, with interaction with Germany and Switzerland. Its mission revolves around two main pillars: innovation and industrial excellence in the service of companies (supervised by the association of the PerfoEST cluster, which is the ARIA for Alsace and Franche-Comté). The cluster focuses on the urban vehicle (eco-design, energy consumption, recycling, etc.) and the organization of mobility (e.g., intermodal connections). In 2014, it developed a program on the factory of the future.
The goal of the Lyon Urban Truck \& Bus cluster (www.lutb.fr) is to meet the challenges offered by the growing need for mobility of persons and goods within towns. It coordinates structuring activities for the region: manufacturers,
transport operators, research centers, etc. The research projects deal with five main themes: modeling and mobility management, engines and drive trains, safety and security, vehicle architecture, intelligent transport system. In 2014, fifteen new projects were approved for a total budget of \(€ 36\) million. The cluster is also associated with the Rhône-Alpes Automotive Cluster, which is the ARIA for the region and has industrial efficiency as one of its areas for development.
Situated in western France (Brittany, Pays de La Loire, Poitou-Charentes), the iDforCAR cluster (www.id4car.org) focuses on special vehicles and sustainable mobility. The four strategic fields of activity are: intelligent on-board systems, vehicle materials and architecture, innovative vehicles and use, and information and communications to do with sustainable mobility.
It is also possible that clusters that do not specialize in the automotive sector also have interests in this field. For instance, three quarters of the markets for Elastopole, a national-scale cluster that covers the regions of Centre, the greater Paris region (lle-de-France), Auvergne and Pays de Loire, which focuses on rubber and polymers, are in the automotive sector. It also cooperates with automotive clusters. I-Trans, a world-class cluster in Nord - Pas-deCalais and Picardy, specializing in sustainable land transportation, is at the meeting point between rail and automotive.

\section*{661}

NUMBER OF COMPANIES THAT HAD A BUSINESS UNIT BELONGING TO A COMPETITIVENESS CLUSTER IN 2012

\section*{French automotive foreign trade}

While global trade was up \(3 \%\) in 2014 , Europe also enjoyed a more dynamic economic environment. Exports of French automotive products were worth just \(€ 39\) billion. The automotive industry was still one of the leading exporters, along with aeronautics and food, accounting for \(9 \%\) of total exports. Two companies in the industry featured in the top five exporters In 2013 in the Customs Department listing.
The recovery of the European market led to a rise in exports (up \(2 \%\) ); imports also advanced ( \(2 \%\) ), with an ever larger share of flows of new cards coming from Germany (valued at \(€ 9\) billion euro). The automotive industry had a trade deficit of \(€ 4.5\) billion.
The positive balance for "parts and engines" dropped to \(€ 4.4\) billion. The surplus is partially explained by the production of sites of French manufacturers outside of France with French supplies, for example for thruster units (surplus of \(€ 2.2\) billion).

In 2014, the automotive industry's share of all goods exports stood at 9\%, against \(12 \%\) in 1997. As for imports, they accounted for 9\% as in 1997, the last time there was a crisis in the French new vehicle market. Exports by the automotive industry were in excess of \(€ 50\) billion in the mid-2000s before falling to \(€ 34\) billion in 2009 with the crisis. Since then, they have fluctuated between \(€ 39\) and \(€ 40\) billion. Exports of passenger cars accounted for more than €25 billion in 2004-2005 before plummeting to €13.7

billion in 2009. After that, they varied between \(€ 13\) and \(€ 16\) billion, due partially to the weakness of the Southern European markets where French auto makers are heavily concentrated. The deficit grew to \(€ 8.6\) billion by 2014.
After falling sharply in 2009, exports of light commercial vehicles and heavy trucks had made a clear recovery in the following two years. Then, in 2013 and more so in 2014, light commercial vehicles increased to \(€ 3.0\) billion. Heavy trucks declined for two years in a row before bouncing back to \(€ 2.6\) billion in 2014. Imports of new light commercial vehicles grew, while those of heavy truck dropped sharply. The deficits turned around to be near equilibrium for light commercial vehicles and \(€ 0.4\) billion for heavy trucks. Exports of parts and motors reduced by \(3 \%\), whereas imports of them grew by \(1 \%\). The deficit worsened to \(€ 4.4\) billion after an improvement the previous year.

\end{tabular}
(1) In these rankings, Customs uses the company,
rather than the group.
Source: Customs.

The major clients of the French automotive industry are European. However, they also include emerging economies, Eastern Europe and North Africa. The five leading destination countries of new passenger cars from France are predominantly European, including three of the four other largest markets in the European Union. In 2014, Belgium ( \(€ 2.5\) billion) is in the lead, ahead of Germany and Italy (around \(€ 1.9\) billion each). Algeria is ranked ninth, with \(€ 322\) million. The top customer for exports of light commercial vehicles is Germany, at \(€ 665\) million. Algeria ( \(€ 184\) million) replaces Spain in the five top purchasing countries in the passenger car classification. In 2014, the values of these exports of light commercial vehicles were higher than those of 2005 . While exports of commercial vehicles larger than five metric tons to the United Kingdom and Algeria continued to be buoyant, they did not offset the deep plunge of the Southern European markets. Exports of parts and motors recovered from their 2010 level. The five leading destinations are European, with Germany in the lead ( \(€ 4.2\) billion). China ( \(€ 776\) million), Slovakia ( \(€ 758\) million) and Brazil ( \(€ 433\) million) are in the range of sixth to tenth. Imports of new passenger cars from Germany ( \(€ 7.2\) billion), from the United Kingdom ( \(€ 1.6\) billion) and from Japan ( \(€ 962\) billion) are at a high level.

LEADING DESTINATIONS OF AUTOMOTIVE EXPORTS FROM FRANCE

* Sources: customs data processed by CCFA.

\section*{GERMANY}

LEADING BUSINESS PARTNER OF THE AUTOMOTIVE INDUSTRY IN FRANCE

\section*{Passenger cars by engine type (diesel, hybrid, and electric, etc.)}

Since 2002, there have been more diesel passenger car registrations than registrations of vehicles running on other fuels. In 2014, they represented \(64 \%\) of total registrations, down after a record level reached in 2012 ( \(73 \%\) ) due to the introduction of three-cylinder gasoline engines. Hybrid and electric engines are emerging in France, with market shares of \(2.4 \%\) and \(0.6 \%\), respectively. In Western Europe as a whole, the development is slower and they represent only \(1.8 \%\) and \(0.5 \%\) of the market. One fifth of all hybrid cars registrations and one quarter of all electric car registrations in Europe were in France, and the French share of the overall market was \(15 \%\).

\end{tabular}

Source: CCFA.

In 2014, France had the second highest number of new diesel car registrations in Europe with 1.1 million, behind Germany with 1.5 million units. \(62 \%\) of cars in use in France on January 1st, 2015 had diesel engines. The increase in this ratio has been declining significantly over recent years. In Western Europe, the market share of new diesel cars has remained practically stable at 53\%, representing 6.4 million units. In this market, French
manufacturers hold a share of \(23 \%\). Looking beyond Europe, the market share of diesel cars in India is around 50\%, and in South Korea between 2011 and 2014 it grew by 20 or so percentage points, to nearly 40\%. In 2014, 1.8 million diesel cars were produced by French manufacturers, down \(24 \%\) from the record level of 2004. The diesel car share of total production (37\%), down slightly from 2013, is still considerably lower than in 2004 (47\%). French manufacturers also supply diesel motors to other brands, pursuant to cooperation agreements.
In 2014, registrations of new hybrid passenger cars came to 43,100 units, down \(8 \%\) after growing \(68 \%\) the year before; registrations of electric cars grew by \(20 \%\), to 10,600 units. The strength of these sales is supported by the Automobile Plan of the French government in July 2012. The French market is the leading market in Europe for these two engine types. In France, French car makers have products in these segments (Renault Zoé, 3008 hybrid, etc.).

-9 POINTS
the reduction in the percentage OF NEW DIESEL-POWERED PASSENGER CARS REGISTERED IN FRANCE COMPARED WITH 2012

\section*{New passenger car registrations by model, range and body style}

The range structure of new cars has developed significantly over the last twenty years. The changes are quite significant. The preponderance of the economy and low range in France reached a peak in 2010 due to the "incentive/penalty" system and the scrap incentive scheme. A slight dip ensued. However, with the updating of the economy passenger car models (108, C1, Twingo) in 2013-2014, and the filling-out of the economy 4WD range (C4-Cactus, 2008, Captur, Duster) this segment was boosted to \(54 \%\) of sales in 2014. MPVs lost their attractiveness since 2010 (down 4 points to \(15 \%\) ), but 4WDs more than made up for the loss (up 14 points to \(23 \%\) ). Station wagons putter along consistently at \(7 \%\) of the market.

\section*{Used passenger cars}

In 2014, used passenger car registrations picked up by \(2.4 \%\) after two years of decline, to 5,446,000 units.
Now, more than five million used passenger cars have been sold since 2000. Every year, two to three used cars are exchanged for every new car: relative to the total number of cars in use, around \(17 \%\) change hands every year. On average, households keep their car for five and a half years (whereas in 2010 it was five and 1995 - four years). The used/new ratio is stable at a record level of 3.0 , well in excess of the levels recorded during previous downturns in the new car market, in 1993 (2.5) and 1997 (2.5).
\(58 \%\) of cars owned or used by households were bought used, versus \(51 \%\) in 1991.
At the time of purchase, the average number of kilometers on their odometers was 70,000 kilometers, and more than a quarter of the used vehicles purchased by households had over 100,000 kilometers on their odometers. In addition, households that own a used vehicle and replace it with a used vehicle account for \(45 \%\) of vehicles replaced in 2012.

\section*{USED/NEW CAR RATIO}

USED/TOTAL RATIO

Passenger cars are durable goods that consumers purchase, use, maintain and eventually sell on the second-hand market.
Used cars are purchased and sold through dealers or directly between consumers. Those less than five years old are usually sold through dealers. They represent about half of the total market
Somewhere between 5 and 6 million used cars are exchanged every year. This market is subject to less fluctuation than the new car market. In 2014, demand for new cars increased slightly by \(0.3 \%\) to 1.8 million units whilst demand for used cars climbed \(2.4 \%\) to 5.4 million units. The used/new ratio remained stable, at 3.0. The demand for used vehicles is generally similar to the growth rate of the entire population, and is less sensitive to economic factors than demand for new cars. It has still been affected by measures to stimulate the new car market (the "incentive/penalty" [or "bonus/malus"] system, government scrap incentive, etc.).
Transactions involving vehicles more than five years old rose due to the aging of the total passenger cars in use and to increasing multi-car ownership in France. This share rose from \(48 \%\) in 1990 to \(66 \%\) in 2014 . Used cars that are less than one year old can be considered new. In fact, they are often registered
by automotive dealers as demonstration or leased vehicles and then sold on the retail market. They represented 424,000 registrations, i.e., \(24 \%\) of the new market, a stable position in relation to 2013, but this weighting is higher than during the years of the scrap incentive plan when new car prices were more competitive. Since 2001, registrations of used cars less than one year old have declined steadily as a percentage of total registrations, only accounting for \(8 \%\) in 2014, versus \(12 \%\) in 2001.
Diesel cars made up \(68 \%\) of all used cars in 2014, up 2 points over 2010, and 13 points over 2005.

\section*{58\%}

PERCENTAGE OF CARS OWNED BY HOUSEHOLDS THAT HAVE BEEN BOUGHT USED

\section*{New vehicle registrations in French overseas departments (DOM)}

The annual markets for new vehicles in France's overseas departments developed more recently than in continental France, and accounted for 60,000 to 75,000 vehicle registrations from 1998 to 2012. The five French Overseas Departments are Guadeloupe, French Guiana, Martinique, Mayotte, and Reunion Island. Since then, the market hovers around 60,000 units, down \(20 \%\) compared with 2007. Given the geographic environment, commercial vehicles over 5 metric tons account for a smaller proportion of registrations in overseas departments ( \(1.3 \%\) ) than in mainland France ( \(2.3 \%\) ). In contrast, the proportion of light commercial vehicles has hardly changed ( \(16.7 \%\) versus \(16.8 \%\) in mainland France). French manufacturers suffer from intense competition in passenger cars; their market share was below \(50 \%\) from 2006 to 2013, though in 2014 it climbed 3 points to be at \(51.3 \%\). However, they are faring better on the light commercial vehicle market (more than \(50 \%\) of the market), which remains much weaker than in the mainland (around two thirds of the market). On the other hand, on the narrow heavy vehicle market, Renault Trucks have a market share of almost \(29 \%\).

New heavy trucks

New light commercial vehicles

NEW PASSENGER CAR REGISTRATIONS
IN FRENCH OVERSEAS DEPARTMENTS

\section*{Household car ownership}

In 2014, multi-car households accounted for \(34 \%\) of the total, compared with \(26 \%\) in 1990 and \(16 \%\) in 1980. Car ownership is very high among households in rural and semi-rural areas, i.e. rural areas located close to towns (nearly \(92 \%\) ). In the greater Paris region, \(62 \%\) of households own cars (the 2000 figure was \(60 \%\) ).
Sixty-three percent ( \(63 \%\) ) of the least well-off households (earning less than \(€ 15,000\) per year) have at least one car. \(79 \%\) of older households own a vehicle, compared with \(69 \%\) in 2000 . The number of people in this age group that has a drivers license and the proportion of drivers continues to increase.

\end{tabular}

Source: INSEE up to 1993, PARCAUTO TNS-SOFRES as of 1994.

The car ownership rate is the proportion of households that own at least one vehicle, expressed as a percentage. It is closely connected to income, the age of the head of the household, the socio-professional group, the residential location and the number of people living in the house.
- \(20 \%\) of the wealthiest households had a car ownership rate of over \(90 \%\) in 2014; 20\% of the least well-off households have at least one car, at over 60\%.
- In towns with over 100,000 inhabitants, the car ownership rate has not declined: \(81 \%\) of these households owned vehicles in 2014, compared with \(75 \%\) in 1995. This ratio has been rising since 2007 in the greater Marseille region (81\%); it falls slightly in the greater Paris region (62\%), and the regions of Lyons ( \(71 \%\) ) and Lille ( \(77 \%\) ).
- Rural households, large households, and workers typically own more vehicles.
- The employee and non-working categories (incl. retired persons) have relatively lower rates, although their car ownership rates have increased considerably since 2000 (by 4.5 and 6.8 points respectively).

Every year, \(2 \%\) to \(3 \%\) of households get rid of their cars. Changes in family situation (death, divorce, etc.), the cost of upkeep, health problems, the alternative of public transit, and parking issues are the main causes.

73\%

CAR OWNERSHIP BASED ON AREA OF RESIDENCE

\section*{Household vehicles in use}

Daily car use has dropped regularly in recent years, with \(71 \%\) of the total car fleet used every day in 2014 compared with \(79 \%\) in 2000. The share of vehicles used for commuting still exceeded \(50 \%\). In 2014, business trips other than commutes rose to \(15 \%\). The fleet ages slowly and typically, except in periods in which the market levels are high such as at the start of the 2000s or during the implementation of the scrap incentive plan. Households are holding on to their cars for longer: in 2014, for 5.4 years; in 2000 for 5 years; and in 1995 for 4 years. The average number of kilometers on the odometer stands at around 104,000 kilometers, i.e. 11,000 kilometers more than in 2000 and 35,000 kilometers more than in 1990. The average number of kilometers on the odometer of a diesel car, which is driving further each year, is advantaging, and is now at 115,700; while gasoline-powered cars are used less intensively, and their average number of kilometers has dropped to 86,700 .

\end{tabular}

Note: Years after 2007 cannot be compared directly with previous years; the scope of light commercial vehicles has been enlarged.
Source: PARCAUTO TNS-SOFRES survey processed by CCFA and IFSTTAR.
Source: PARCAUTO TNS-SOFRES survey processed by CCFA and IFSTTAR.

An annual SOFRES survey gives a clear picture of the cars owned or available

\section*{to households in France.}

Most of these vehicles are passenger cars, but light commercial vehicles account for about \(5 \%\) of the total. In 2014, nearly two-thirds of cars on the road were more than five years old; the number of cars 10 years old or greater reached an historic high of \(31 \%\). The average age of a gasoline car was 10.3 years, and that of a diesel - 7.8 years. The most common taxable horsepowers were in the 4 to 7 HP categories. Low and low-mid range cars have become more popular in recent years, representing respectively \(49 \%\) and \(30 \%\) of the total number of cars in use in 2014, to the detriment of high mid-range models, where the share is \(9 \%\). Luxury or comfort equipment are increasingly popular; in 2014, \(73 \%\) of cars were fitted with air conditioning. In terms of safety equipment, numbers have also risen: \(67 \%\) of vehicles have ABS, \(44 \%\) a speed-limiting device, and 35\% a central stability system (ESP); the numbers in 2007 were 47\% for speed-limiting devices and \(18 \%\) for [latter two]. Customers are starting to want "Stop \& Start" equipment installed, and it extends to \(11 \%\) of all new cars.

\section*{71\% and 52\% \\ RESPECTIVE SHARES OF VEHICLES USED ON A DAILY (OR NEAR-DAILY) BASIS AND FOR TRAVEL TO AND FROM WORK}

VEHICLE USE

\section*{Domestic passenger transport}

Personal transportation is both a social and an economic issue: it makes exchanges possible between people, is the source of the creation of riches and jobs, and is specially suited in many sectors, such as health and tourism.
When expressed as passenger-kilometers, which under-represents urban transport and focuses on domestic transport to the exclusion of long-distance international transport, roads emerge as the dominant mode for passenger travel: \(83 \%\) for passenger cars and \(5 \%\) for coaches, buses and trams in 2014.
The passenger car and the light commercial vehicle are both able to provide transportation from door to door. They accommodate people's restrictions (elderly people, children, the disabled, carriage of heavy or awkward objects) and are appropriate for traveling to places of residence that are spread out or which are too small to have good public transport options.

+0.7\%
DECLINE IN 2014 IN DOMESTIC PASSENGER TRANSPORT IN ALL MODE, EXPRESSED IN PASSENGER-KILOMETERS PER NUMBER OF INHABITANTS.

Personal transport is obviously linked to the economy, as is the transport of freight, but it also includes the vital social aspect of meeting people.
Whereas freight is more closely associated with industrial, agricultural and craft production, personal transport covers a much broader economic sphere. While commuting between home and work is predominant, the developing service economy also depends on the mobility of people; this is particularly important in such personal services as health and tourism.
People select their mode of transport and their mode for freight transport on the basis of their starting point/destination, distance and time, and the amount/volume of belongings to be transported.
Transporting people requires significant capital expenditure in each mode and is generally paid off over a long period during which the infrastructure is built and maintained.
When measuring transport in terms of passenger-kilometers, light vehicles tend to dominate in domestic passenger transport. This can be expressed as the number of daily trips, particularly in dense urban areas where transport facilities and other methods (bicycles, motorcycles, etc.) play an important role, or as passenger-kilometers when dealing with international long distance travel, showing the relevance of each mode of transport:
Domestic passenger transport expressed in passenger-kilometers rose continuously until 2002 (up 19\% since 1990). Since then, it appears to have tailed off due to rising fuel prices, and dropped by \(1 \%\) between 2002 and 2013. In 2014, there was a slight rise in the domestic transportation of passengers (up 0.7\%), chiefly associated with the increase in the number of passenger kilometers in passenger cars (up 0.8\%).

\section*{Domestic freight transport}

Transporting freight drives the economy, enabling production sites to connect with each other and with consumer sites, which in turn link to reprocessing-recycling plants. The time dimension must be added to this spatial model, often associated with town and country planning. Each mode of transport-road, rail, inland waterways, pipeline, etc.depends on infrastructure that requires the kind of large-scale capital expenditure that is generally paid off over a long period. Road haulage meets many of the criteria involved in selecting a transport hub. It retains a stable share of freight shipping (around \(85 \%\) of the ton-kilometers done) and distances shorter than 300 kilometers predominate, meaning that there are few choices: \(57 \%\) by weight of the French freight loads are delivered within a radius of 50 kilometers.

DOMESTIC FREIGHT TRANSPORT IN FRANCE

BREAKDOWN OF FREIGHT TRANSPORT USING FRENCH CARRIERS ACCORDING TO THE LOAD DISTANCE IN 2014

The demand for freight transport is closely linked to the economy of the country and its interactions with other countries; it corresponds, on the one hand, with the domestic demand of various economic players and, on the other hand, with exports of producing companies in the country. Some countries, such as Germany and France, act as key freight transit countries due to their geographical locations. In the case of road haulage, this also leads to the phenomenon of cabotage but also, for some years now, to the arrival of foreign players who take increasing market share from French carriers. The physical transfer of goods exported by a country is a major focus of economic competitiveness. Among other factors, it should not be too expensive compared with other countries in order to promote exports. The destination and the type of freight or goods traded are often critical when choosing the appropriate mode of transport. Some liquids can be transported via pipelines, thereby avoiding any disruptions in supply; ports are used for trade with distant countries. Domestic demand from economic players covers a very varied range of goods and properties. This demand is met either by domestic production or by imports, and transport provides a physical connection among production sites and with consumer markets, and finally between the latter and reprocessing-recycling plants. In France, this has a major impact on town and country planning.
Because of the great variety in goods, many factors influence the choice of mode of transport. Among them:
- the weight of the goods: automotive manufacturers mainly transport coils of steel by rail or waterways;
- the value of the goods transported:
- delivery time: perishables such as fresh products must be transported quickly-usually by road;
- departure and arrival sites, both in production (linked with town and country planning) and in consumption. This mostly means households living in built-up areas. Different modes of transport also depend on a specific infrastructure.

This entails large-scale capital expenditure, usually paid off over a long period, and careful deployment. Intensive usage, due to massive traffic flows, makes the infrastructure issue all the more relevant, as does the use of several different modes of transport in a single logistics chain, where there will be interruptions when loads are shifted from one mode to another. Due to its flexibility, ability to pervade the entire road network, adaptability and quality of service, road haulage addresses many of these factors, demonstrating that rather than being a single homogeneous market, road transport consists of a multitude of sub-markets, which often cannot replace each other. No choice of mode is available for most goods transported, particularly in the last few kilometers because it increases the transportation distances. Good intermodal connections require acceptable costs and changes in efficient transport means. Ignoring the geographical location of the departure and arrival sites, there are two basic units for measuring the transport of goods: metric tons measured when loading and metric ton-kilometers. Roads remain the dominant mode of shipping goods, accounting for \(85 \%\) by weight. The French Ministry of Transport's Road Freight Haulage Survey shows that nearly \(60 \%\) of French freight metric tons is carried less than 50 km from their source, and that \(54 \%\) of French metric ton-kilometers travel less than 300 km .

\section*{STABILITY}

OF DOMESTIC FREIGHT TRANSPORT MEASURED IN METRIC TONS-KILOMETERS IN 2014 COMPARED WITH 1998

\section*{Road traffic}

Road traffic increased by an annual average of \(2 \%\) between 1990 and 2004, and then remained relatively stable until 2012 (+ \(0.2 \%\) per year). Nonetheless, in 2013 and 2014, it grew at a healthier rate (respectively \(0.7 \%\) and \(0.8 \%\) ). The low level of economic activity is still applying a damper to road shipping of goods, as shown by the drop (of \(1.5 \%\) ) in the traffic of heavy trucks in 2014. However, even though there has been a sharp decline (of 4.5\%) in the traffic of heavy trucks registered in France, foreign heavy trucks saw \(5 \%\) more kilometers added to their itineraries.
In the sector of road transport of people, the traffic of passenger cars registered in France increased (1\%) in 2014, against a backdrop of declining prices for fuel and the expansion of new transportation modes (such as car sharing). Buses and coaches also traveled further in 2014 (1.7\% more).

\end{tabular}
(1) Including vehicles registered abroad and motorized two-wheelers.

Sources: The accounts of the Nation's transportation, MEDDE/SOeS, INSEE,

Automobile traffic is estimated by comparing vehicle counts on national, regional, local and urban roads with the average number of kilometers covered per year by all the vehicles in use and fuel consumption data. It also includes data on vehicles registered abroad.
Road transportation accounted for \(88 \%\) of all domestic transport for passengers 2014 and \(85 \%\) for freight.
In 2014, the number of French-registered vehicles on the road rose by \(0.4 \%\), comparable to previous years, but far lower than in the 1990s.
More drivers are continuing to adopt diesel (from 66.7\% of vehicles in 2013 to \(67.3 \%\) in 2014), though at a slower rate ( \(0.8 \%\) ). Diesel motors were to be found in \(79 \%\) of light vehicles in France, up from \(55 \%\) in 2000 and \(31 \%\) in 1990. For gasoline engines, four cars out of five are now compatible with premium unleaded (95-E10), which accounts for \(32 \%\) of all gasoline-powered deliveries. The average unit consumption of passenger cars continues to decline with the
improvement in technical performance, despite the impact of overconsumption associated with the incorporation of biofuels, whose energy quotient is lower than that of conventional fuels.
Over the last ten years, the average unit consumption of diesel cars dropped by \(6 \%\), and that of gasoline-powered cars, by \(4 \%\).

SHARE OF DIESEL ENGINES IN THE LIGHT VEHICLE TRAFFIC IN FRANCE

\section*{Road traffic and \(\mathrm{CO}_{2}\) emissions}

The number of French and foreign vehicles on French roads has increased by \(36 \%\) since 1990, while the corresponding \(\mathrm{CO}_{2}\) emissions have risen by only \(7 \%\). The credit for enhanced energy efficiency stems from a variety of factors. The average consumption per registered vehicle on the road in France (including impacts on overconsumption associated with biofuels) decreased by nearly \(20 \%\) between 1990 and 2014, as a result of the increased percentage of diesel-powered vehicles, auto improvements and changes in driving behavior, as well as the effects of the incentive/ penalty ("bonus/malus") system implemented in 2008. On the other hand, the quantity of \(\mathrm{CO}_{2}\) emissions, net of renewable energy, required for a heavy truck to transport one metric ton of freight one kilometer across France dropped by \(29 \%\) between 1990 and 2014, despite the impact of the financial and economic crisis.

TRAFFIC IN FRANCE AND CORRESPONDING \(\mathrm{CO}_{2}\) EMISSIONS NET OF RENEWABLE ENERGY SOURCES

\section*{ANNUAL GROWTH RATE OF PASSENGER CARS ON THE ROAD IN FRANCE}

Passenger car traffic involves the number of vehicles on the road and the average number of kilometers they cover in a year. Over the long term, the increase of the number of cars in use has slowed down and now shadows the growth of the population as a whole. The growth in multiple car ownership and the sharp rise in fuel prices are behind the drop in the average number of kilometers driven per year by passenger cars.
In 2014, the first estimates from the Centre Interprofessionnel Technique d'études de la pollution atmosphérique (CITEPA - Technical Interprofessional Center for Studies of Atmospheric Pollution) for road transport report \(\mathrm{CO}_{2}\) emissions net of renewable energy sources of 118 million metric tons. After the stable situation observed in the early 2000s, a clear drop was observed linked to the effects of the economic crisis and also to the increase of biofuels in fuel deliveries. For 2012,

AVERAGE CONSUMPTION OF A PASSENGER CAR ON THE ROAD \({ }^{(1)}\)

CHANGE IN TRANSPORT ENERGY EFFICIENCY \({ }^{(2)}\)

\section*{Passenger transport price indices}

In 2014, because of the drop in fuel prices, the growth rate in the price index for passenger cars (purchases and use) became negative (minus \(0.2 \%\) ). The index of rail passenger prices increased by \(2 \%\), which is in the range of recent years, of between 2 and \(3 \%\) inclusive, except for 2012, when it rose by \(4 \%\). The price index for the road transport of passengers (not including taxis) rose for the third year in a row, powering ahead in 2014 by \(3 \%\).
Since 2009, real price indices for different modes of passenger transport changed in very different ways: from a drop of \(6 \%\) for road transport of passengers (not including taxis) to a rise of \(8 \%\) for private vehicles, with a slight fall ( \(7 \%\) ) for air transport and an increase of \(6 \%\) for rail transport.

ANNUAL VARIATION IN PRICE INDICES FOR DIFFERENT
PASSENGER TRANSPORT MODES

\hline
\end{tabular}
(1) The methodology for calculating the price index for air transport services changed in January 2012. The variation between 2011 and 2012 cannot be considered to be significant.
Source: INSEE.

The price indices of the various passenger transport modes show evolutions in prices inclusive of tax. So, for air transport, this includes airport tax; in other modes, infrastructure-related costs are only shown insofar as they can be included in the retail price. Furthermore, only the part paid directly by the household is considered. For example, if a region or a local authority decides, in the context of a town or country planning strategy or social measures, to subsidize a part of transport-related expenses, this will appear as a reduction in household expenses. Fuel surcharges are included in the index for air transport of passengers.
The indices for rail and road transport of passengers predominantly relate to intercity links. The index for passenger cars was defined including purchasing as well as running expenses. To calculate the actual change in the real prices of these main modes of transport, these indices have been adjusted in the chart above by the consumer price index.
After remaining close to their 1995 levels, the tax-adjusted price indices for different modes of passenger transport have had varied evolutions since 2003. From 2003 to 2014, the tax-adjusted personal car index (purchases and use of private cars) rose \(16 \%\), and sharply exceeded its 2000 level. The index for rail transport increased by \(12 \%\), continuing the growth started in 2000, while the index for road transport of passengers (excluding taxis) fell by \(17 \%\); it is important to remember that only the part paid directly by the households is taken into consideration.

\section*{\(+0.8 \%\) and +4.6\%} RESPECTIVE RISES IN THE PRICE INDICES LINKED TO PRIVATE VEHICLES AND RAIL TRANSPORT OF PASSENGERS

\section*{Freight transport price indices}

In 2014 the road freight price index remained stable (advancing just 0.1\%) for the first time since 2010. Between the first quarter of 2014 and the first quarter of 2015, the index even declined by \(1.2 \%\) due to the fall in diesel fuel prices. The freight shipping indices other than by road were inconsistent among themselves. They were up ( \(2.9 \%\) ) in sea transport, but declined in river transport (by 0.9\%), air (by \(1.6 \%\) ) and rail (by \(4.4 \%\) ). Since 2006, the price index of freight transport by road rose by \(1.6 \%\) per year on average, from \(1.5 \%\) for intercity to \(1.7 \%\) for international and proximity freight transport by road. Over the same period, the fluvial index showed a lesser change (a \(0.9 \%\) increase per year), varying from \(-0.1 \%\) for international transport to \(1.9 \%\) for domestic transport. In river transport, the price index has been published only since 2014, with a history dating to the first quarter of 2012. Over the observation period, a \(0.4 \%\) decline is evident, chiefly due to a heavy fall in 2014 (by 4.4\%).

- Road transport: local

fluvial and air transport, the infra-annual variations are less considerable, even though fuel accounted for between \(20 \%\) and \(30 \%\) of the total cost of road haulage, as shown by the CNR survey (cf. page 51).
In connection with the major volatility of fuel prices, the air freight price index has fluctuated greatly since 2006. After rising in 2013, the index fell in 2014 (by \(1.6 \%\) ). The price index for maritime freight is very volatile, following the changes in bulk prices. After two years of significant decline, it grew \(4 \%\) in 2013, then \(2.9 \%\) in 2014. Available since 2000, the fluvial freight price index increased every year, with the exception of the drop in 2009. It declined in 2014 by \(0.9 \%\). To conclude, the rail freight index continued its decline which began in the third quarter of 2013 . Over 2014, it fell by \(4.4 \%\), but with large variances between the domestic, which plummeted by \(5.3 \%\), and the international which achieved a rise of \(1.4 \%\).

STABILITY
IN 2014 OF THE ROAD HAULAGE PRICE INDEX

\section*{Household motoring costs}

Due to the rise in fuel prices between 2006 and 2011 (of more than 20\%), car-owning households increased their automobile-related expenditures by nearly two points, to \(18 \%\) of their budget. Fuel accounted for \(80 \%\) of that rise; for the highest earning \(20 \%\) (Q5), the proportion was two thirds, while for the \(60 \%\) lowest earning households (Q1-Q3), the fuel component accounted for more than \(90 \%\) of the rise. In 2011, the fuel component represented a little more than \(4 \%\) of the budget of Q5 households, while it was \(6 \%\) for Q1-Q3 households. Changes occurred between 2006 and 2011 in the distribution of expenditure on purchases of new cars (NC) and used cars (UC) and maintenance, repairs, parts \& accessories (MRPA), some of which can be partially explained by purchases made using a scrap incentive plan in 2010-2011. For Q1-Q3 households, while the weighting of the MRPA component increased slightly, the rise in the weighting of the NC component was nearly offset by the decline in the UC component. For Q4-Q5 households, the weighting of the NC component mushroomed from \(1 \%\) to more than \(5 \%\), while that of UC rose slightly, while the MRPA component declined 0.4 point to well under \(2 \%\).

MAINTENANCE, REPAIRS, SPARE PARTS AND TRANSPORT INSURANCE'
(As a \% of total consumption)

CAR PURCHASES
6 (As a \% of total consumption)

FUEL COST FOR HOUSEHOLDS, INCLUDING THOSE WITHOUT CARS, BY RESIDENCE AREA

FUEL AND OTHER USE-RELATED SERVICES (mainly tolls)

with nearly two thirds in 2005-2006), whereas nearly two thirds of Q5 households buy new cars.
While nearly \(5 \%\) of total consumption is devoted to fuel, only the richest quintile spends much less on consumption for this item. The same goes for transport insurance. As these items are taxed most heavily, it looks as if car-owning Q1-Q3 households pay more taxes than households in the richest quintile for the use of their vehicles in proportion to their consumption.
By breaking down all households (car owners or not) into categories of residence location, fuel appears to play a higher role the smaller the town. This means that households in the Paris area spend \(3 \%\) of their consumption on fuel whereas people in rural areas spend more than \(6 \%\).

\section*{6\%}

WEIGHT OF FUEL IN THE TOTAL CONSUMPTION OF THE LEAST WELL-OFF HOUSEHOLDS (Q1-Q3)

The Family Budget surveys conducted every five years by the French National Institute for Statistics and Economic Studies (INSEE) reveal the proportion of large consumer items in the household budget and provide data on the various household categories: socio-professional group, age, income, residence area, etc. There are two important differences for typical car items when compared to national figures. With respect to transport insurance costs, the full cost is factored into the surveys, while only the service (i.e. spending minus repayments) is recorded at the macroeconomic level. When it comes to spending on used vehicles, the full cost is reflected in the surveys, while at the macroeconomic level, this spending corresponds mainly with the margins made by professionals involved in a transaction, and does not include transactions between individuals.
Some charts show the breakdown of different car items as a percentage of total consumption, equivalent to individual consumption (excluding rent) based on income, broken down by \(20 \%\) segments of the population: Q5 is the fifth quintile, i.e. the \(20 \%\) of households with the highest earners, ahead of Q4 and then the combination of Q1 to Q3.
In 2010-2011, the vehicle budget for all car-owning households amounted to just over \(18 \%\) of their total consumption. New and used car purchases account for barely half, ranging from \(7 \%\) for the \(60 \%\) of households with lowest incomes to \(9 \%\) for the fifth quintile. Nearly \(60 \%\) of households in Q1-Q3 buy used cars compared

\section*{Road freight cost price}

According to the CNR, between 2002 and 2014, the annual mean of the cost price for long-distance and regional road freight rose by \(33 \%\), or an average of more than \(2.4 \%\) a year.
The share of commercial diesel in the cost price of long-distance road freight rose to \(22 \%\), as opposed to \(26 \%\) in 2010 and \(20 \%\) in 2001.
In 2014, the cost of equipment ownership (road tractors and semi-trailers) represented \(12.3 \%\) of the total cost (as opposed to \(11.7 \%\) in 2010 and \(14.7 \%\) in 2001), and the share associated with infrastructure went as high as \(6.9 \%\).

ROAD FREIGHT COST PRICE STRUCTURE FOR LONG DISTANCE

The National Road Transport Committee (CNR) publishes, among others, two indexes showing changes in the cost of professional road transport: one for long distances and the other for regional transport.
Long-distance transport covers national or international transportation by a maxi-code articulated truck and trailer where operating restrictions make it impossible or uncertain for the driver to return home each day.
Regional transport, with vehicles carrying a total load of between 3.5 and 19 metric tons, refers to transport within a region and its neighboring regions, where operating conditions enable the driver to return home each day.
Between December 2001 and 2007, commercial diesel, together with substantial increases in oil prices, took an increasingly large role in the production cost of long-distance road freight; during that period, its share rose from \(20 \%\) to nearly \(28 \%\) of the total price. In 2008, because of the drop in oil prices after the summer, the share of diesel fell to \(22 \%\) before increasing to reach \(29 \%\) in 2011 and dropping slightly in the next three years, to be \(22 \%\) in 2014 . From 2001-2014, infrastructure costs increased by 2 points to \(6.9 \%\). On the other hand, equipment ownership (road tractors and semi-trailers) and maintenance (upkeep and repairs) dropped by 2.4 and 0.9 percentage points respectively, a little more than the decline for haulage employees (down 0.7 percentage

ROAD FREIGHT COST PRICE STRUCTURE IN DECEMBER 2014

points). In the case of regional transport, fuel accounted for \(16 \%\) of combined costs in December 2014; this lower percentage is one of the causes of the weak growth of more than two points in the regional index between 2002 and 2014 when compared with the long-distance index. The share for equipment ownership rose by between \(20 \%\) and \(22 \%\) over the same period.

\section*{DROP IN THE SHARE OF COMMERCIAL DIESEL IN THE CNR INDEX OF LONG-DISTANCE ROAD FREIGHT COSTS SINCE 2011}

\section*{Automotive price indices}

In 2014, the new passenger car price index rose by \(2.1 \%\), 1.6 percentage points faster than inflation. Since 2013, the new car price index has decreased by \(1 \%\) in real terms, before advancing slightly in 2014. The tightening of the green penalty ("malus") scales contributed to this rise. This downward trend over several years has also been observed for Europe as a whole. In 2014, the real price fuel index fell again, but remains at a high level ( 148 compared with 160 at the peak in 2012, i.e., a decline of \(8 \%\) ). The price index for spare parts, accessories, and vehicle maintenance and repair rose by \(2.6 \%\) in 2014. The changes within that figure, however, are divergent; ranging from a decline of \(1.5 \%\) for tires to an increase of \(3.1 \%\) for the hourly cost of labor for repairing private cars.

YEAR-ON-YEAR AUTOMOTIVE PRICE CHANGES
\begin{tabular}{|c|c|c|c|c|}
\hline & Consumer prices & New car prices & Prices of car parts, accessories, repair and maintenance & Fuel prices \\
\hline 2012 & 2.0\% & 2.6\% & 2.5\% & 4.9\% \\
\hline 2013 & 0.9\% & 2.2\% & 2.7\% & -2.5\% \\
\hline 2014 & 0.5\% & 2.1\% & 2.6\% & -4.0\% \\

NEW PASSENGER CAR, FUEL, PARTS, ACCESSORIES, MAINTENANCE AND REPAIR PRICE INDICES

RETAIL PRICE OF DIESEL IN FRANCE AND THAT FOR JANUARY 1999, INDEXED FOR CONSUMER PRICES

HARMONIZED PRICE INDICES FOR THE EUROZONE (17 COUNTRIES)

\section*{-6.0\%}

\section*{IN THE PRICE OF FUEL IN 2014 COMPARED} WITH 2012

The new car price index compares the prices of passenger cars with similar technical characteristics, so that price rises resulting from quality and equipment improvements can be factored out. Allowance is made for periodic rebates (except by mutual agreement) as well as the "incentive/penalty" system. To calculate the actual change in the key components of the cost of owning a car, these indices have been adjusted by the consumer price index in the first graph above. Since 1992, car prices have continued to decline steadily in real terms due to the regular impact of competition and occasional impact of government support measures (the incentive/penalty ["bonus/malus"] system and scrap incentive scheme since 2008). However, the increase in the green penalties led to a \(2.5 \%\) price rise in January 2014 over December 2013. Since 2003, many factors have led to an increase in the index of real prices of repairs and
maintenance, including labor (cost of work, development of skills, etc.) and parts (improved reparability, raw material prices, increased quality of service, greater diversity of models requested by consumers). In the eurozone (17 countries), Eurostat calculates a new and used car price index; the data from the various countries are then harmonized. Since 1996, the evolution of this index compared with that of the general price index has shown intense pressure, as in France, on prices associated with the stiffness of competition and strains on household's purchasing power. In 2014, the general price index rose \(31 \%\) compared to 2000, whilst that of new and used car purchases only grew by \(12 \%\).

\section*{Consumer spending on private vehicles}

The stability of the prices enabled household purchasing power to rise in 2014 (by 1.1\%), after stagnating in 2013. Expenditure on household consumption also continued to recover, rising \(0.6 \%\) in 2014 (compared with \(0.4 \%\) in 2013). Similarly, purchases of new vehicles was boosted (by \(2 \%\) ) after two years in a row of decline, reaching \(€ 23.8\) billion. However, over the long term, the share of a car purchase in household consumption is reducing, at the expense of the new vehicle.
In 2014, households' fuel purchases contracted again due to the impact of the reduction in the crude oil price. Fuel cost \(€ 37\) billion, declining \(3.7 \%\) over 2013. This amount is the same as that spent on purchases of new and used cars, whereas it was much lower at the start of the 1990s.

\hline
\end{tabular}
(1) These are provisional data and can be readjusted for three years. Source: INSEE - Household consumer spending, 2014 - base 2010

PERCENTAGE OF HOUSEHOLD BUDGET ALLOCATED
TO OWNING A CAR, 1990 TO 2014

TOTAL VEHICLE-RELATED EXPENDITURE

According to the national accounting data, which are based on different concepts than those obtained by the family budget survey (cf. page 50), in 2014 households spent \(€ 131\) billion (up \(0.1 \%\) ) on their individual transport (compared with \(€ 137\) billion in 2011). This amount represents \(83 \%\) of the total spending that households devote to transport (individual and public).
Consumer spending on cars, relative to total consumer spending, is expressed as the percentage of household budget allocated to owning a car. This ratio varied between \(9 \%\) and \(11 \%\) from the start of the 1990s until the 2009 crisis. Since then, it has fluctuated around \(9 \%\), and only reached 8.7\% in 2014.
Within this consumer spending, purchases of vehicles is now in second place behind operating costs (not including fuel), whereas prior to 2012 it was the leading facet of expenditure. The
downward trend of vehicle purchases is pressuring the budget ratio, which was only \(2.7 \%\) in 2014, as against \(4.3 \%\) in 1990. This drop comes at the expense of purchases of new cars, which now account for just \(66 \%\) of vehicle purchases, compared with \(82 \%\) in 1990.
The budget percentage allocated to maintenance and repairs of private vehicles, which had increased during the 1990s, in line with the growth of car ownership and the increase of the average age of the cars in use, has been declining since 2008 (when it was \(2.5 \%\) ) and has now stabilized at around \(2.3 \%\).
Household spending on car insurance, which corresponds to the service-namely spending minus reimbursements-came to \(€ 7.7\) billion.

SHARE OF VEHICLE PURCHASES AS A PERCENTAGE OF TOTAL HOUSEHOLD SPENDING FOR 2014

\section*{Automobile financing}

In 2014, 63\% of new cars purchased by consumers were bought on credit. After the end of the scrap incentive schemes, the level observed between 2003 and 2008 was regained.
Similar to the previous years, car (or conventional) loans were the most common source of financing (46\%) ahead of personal loans (29\%) and lease-financing (24.5\%). Lease-financing can be broken down into lease financing with a purchase option (93\%) and lease-financing without a purchase option ( \(7 \%\) ). Conventional loans reached a peak in 2012, then lost nearly 5 points in two years, while over the same period, the share of lease-financing (with or without purchase option) gained 6 points. The use of personal loans also declined over the same period, then even more between 2013 and 2014, losing 3 points in a year.
For new vehicles used by companies (passenger cars and light commercial vehicles and heavy trucks), the large increase of 2014 was reflected in a rise in financing, after a decline for two consecutive years. This financing was chiefly via leasefinancing with a purchase option and long-term leasing, and a slightly larger increase was seen in passenger cars over the other categories.

TOTAL AMOUNTS OVER TWELVE MONTHS OF NEW CONSUMER
LOANS TO INDIVIDUALS (NOT INCLUDING OVERDRAFTS)
LOANS TO INDIVIDUALS (NOT INCLUDING OVERDRAFTS)

INTEREST RATES OF NEW CONSUMER LOANS TO INDIVIDUALS (NOT INCLUDING OVERDRAFTS)
(As a \%)

Buyers of new and used cars have the choice of paying cash or purchasing the vehicle on credit.
There are three types of financing on offer:
- car or conventional loans provided either by the finance subsidiaries of the manufacturers and importers, or by the subsidiaries of financial or banking groups, which are independent from the manufacturers;
- lease financing, with or without a purchase option (LPP); the lessee has the use of the vehicle and pays rent over the term of the lease, which may be as long as 84 months, i.e. seven years. He can use his purchase option during the lease or at the end of the lease period;

\section*{- personal or bank loans.}

Data obtained from a variety of sources (industry associations, registration statistics, surveys) are used to estimate the percentage of new cars purchased with loans.
Between 2003 and 2007, use of consumer credit rose sharply in France: using data over twelve months, new consumer loans (excluding overdrafts) rose from €38 billion in January 2003 to over \(€ 56\) billion at the start of 2008, an average annual increase of \(8 \%\). Over the same
period, home loans rose from \(€ 57\) billion to \(€ 145\) billion, an annual average of \(20 \%\). Such growing debt has helped offset lower rises in purchasing power noted by INSEE for all households. After dropping by \(12 \%\) between January 2008 and July 2011, due to the financial and economic crisis, production of consumer loans fluctuated between \(€ 49\) billion and \(€ 50\) billion until mid-2012, declining to \(€ 48\) billion in 2013 and remaining at that level. Within these new loans, there was an increase in the financing of new passenger cars by individuals in 2014, due to the stabilization of the auto market. Financing has evolved significantly over recent years, in favor of lease-financing with a purchase option, which shot up in 2014 by 16\%, to the detriment of conventional dedicated loans, which dropped 6\%.
24.5\%

SHARE OF NEW CARS PURCHASED ON CREDIT BY CONSUMERS IN FRANCE USING LEASE-FINANCING WITH OR WITHOUT PURCHASE OPTION.

\section*{Car and motorcycle sales and repairs}

Motor vehicle sales in 2014 generated gross revenue of \(€ 72\) billion, a little higher than in 2013, after the two years of decline that followed the end of the market support measures (amounting to a drop of \(9 \%\) between 2011 and 2013). By 2014, volumes were back to 2008-2009 levels. After increasing by more than \(4 \%\) per year between 2000 and 2008, car maintenance and repairs dropped by \(3.5 \%\) per year by value between 2008 and 2012. Since then, revenues have stabilized at around \(€ 20\) billion. According to the INSEE, \(6.5 \%\) of companies working in automotive sales and repairs were controlled by one group in 2009, compared with \(6.1 \%\) in 2007 (excluding franchises). They represented \(50 \%\) of the staff in this industry and \(49 \%\) of the value added. This concentration of companies is found in the statistics of sales of new vehicles by automobile retail groups. Between 2001 and 2012, each retail group belonging to the ten largest sold on average each year more than 1,000 new vehicles more. The one hundred largest groups each saw their sales grow by more than 300 new vehicles per year. These changes are connected with an increased geographical coverage and an expansion of outlets selling more than one brand. The ten largest groups sold nearly 300,000 new vehicles in 2014, making \(14 \%\) of total sales for revenue of \(€ 9.8\) billion. The 100 largest groups represented \(40 \%\) of total sales, or 890,000 new vehicles for revenues of \(€ 29.5\) billion.

Vehicles require special care throughout their service life: this care includes continuous supervision whenever and wherever necessary with optimum servicing in order to maintain the vehicle's initial qualities.
Vehicle manufacturers, their official dealers and their repair specialists thus work closely to provide maintenance and repairs. They also cooperate to ensure warranty ser-
vice, driver safety, environmental protection, spare parts availability and information about technical improvements.
To ensure a high quality of service from both sales and customer support, dealer networks are based on carefully selected distributors and repair specialists capable of meeting make and customer service requirements.

\section*{? \()^{2}\) BILLION}

NET TURNOVER, IN 2014, OF CAR SALES AND REPAIRS in FRANCE, ACCORDING TO INSEE

\section*{Recycling}

Recycling is all those techniques used to process waste after it is recovered, aiming to reintroduce all or part of it into the production cycle. Automotive recycling involves the vehicle and its consumables (tires, oils, batteries). ADEME supplies some data on the magnitude of recycling in the automotive industry. An end-of-life vehicle (ELV) is a vehicle whose last owner designates it for destruction. More than 1.1 million ELVs were processed by the

In France, around 1.1 million vehicles were dealt with by the certified end-oflife vehicle process in 2013 and dealt with by around 1,600 certified establishments: ELV centers. First, the vehicles are decontaminated: fluids are drained (oils, fuels, brake fluid, air-conditioning fluid, etc.), batteries removed, pyrotechnic devices stored safely. Some of the vehicle's parts, if in good working order, are then recovered, sorted, and checked, before being reused (e.g., engines, doors, headlights). The vehicle is then crushed so as to separate the various materials that make it up. Those materials, when sorted, can be used again to manufacture other products. Selling the used spare parts contributes to reaching the recycling rates and to enabling the ELV centers to break even. The level of collection and processing of the ELVs and the automobile com-
ponents is associated with the market situation of new vehicles, the economic context, the introduction over the given period of a system supporting the removal of older vehicles from the fleet, the technical progress that reduces the frequency of replacing components. The processing of the end-of-life vehicles must comply with levels of performance defined in European regulations: 85\% recovery, of which \(80 \%\) recycling today, and \(95 \%\) recovery, of which \(85 \%\) recycling as of 2015.
In 2013, the material breakdown of an ELV generates: 75\% metals (ferrous metals: \(70 \%\) non-ferrous metals: \(4 \%\) and electrical wiring: 1\%), \(10 \%\) plastics, \(3 \%\) tires and \(1 \%\) starting battery. The average weight of a passenger car is around one metric ton. Some consumable portions of vehicles are also recyclable
certified processes in 2013, compared with 1.5 million between 2009 and 2011 (the period of the scrap incentive program), and fewer than one million units in 2007. Certified ELV centers accept ELVs at no charge and are responsible for decontaminating them, recovering certain used parts and sending the vehicle to the approved crusher.

COMPOSITION OF AN END-OF-LIFE VEHICLE IN 2013
Source: Ademe, Syderep 2014.

during the vehicle's life. The number of automobile batteries marketed came to 7.9 million units in 2013 (down \(4 \%\) over 2012), one quarter of them coming from French manufacturers. They weigh the equivalent of 125,000 metric tons. Almost all (99.9\%) of vehicle batteries were lead-containing batteries; the remainder ( \(0.1 \%\) ) were traction and starter batteries from hybrid vehicles, which are increasing in number (up 29\% over 2012). The collection rate is at its lowest level since 2009 (down \(11 \%\) over 2012), to 184,381 metric tons. French operators processed more than 212,000 tons of batteries, of which four fifths came from France, down by \(12 \%\) over 2012 due to the lower collection rate.
The increase in tire collection since 2004 (200,000 metric tons) is considerable (390,000 in 2013). However, although the amounts collected dropped \(1 \%\)
between 2012 and 2013, the collection rate is better ( \(86 \%\) as against \(80 \%\) in 2012), due largely to the significant reduction in the amounts marketed in 2012. The processing rate of used tires increased by \(1.3 \%\) over 2012, to \(92 \%\). Fifty-one percent ( \(51 \%\) ) of these tires go for energy recovery, \(21 \%\) for granulation, \(11 \%\) for resale on the used parts market, \(10 \%\) for public works, and \(5 \%\) for recapping. Maintaining the vehicles on the road generates 240,000 metric tons of used motor oil each year. One of the requirements of recycling these oils, which are collected free of charge by certified collectors, is that they not be mixed with any other liquids (including water, cooling fluids and solvents). The oils are then regenerated where possible (accounting for a third of the volume) or subject to energy recovery.

\section*{Production of the automotive industry and its economic impact}

After the upticks recorded in 2010 and 2011, the output of the automotive industry declined again in 2012 (down \(9 \%\) ) and 2013 (down \(5 \%\) ) to \(€ 53\) billion, equivalent to just \(9 \%\) above its level in 2009, the year of the financial crisis. Meanwhile, it had been fluctuating between \(€ 70\) and \(€ 77\) billion per year between 2000 and 2007. In the new 2010 basis, in which the research and development expenditure is accounted for as "gross fixed capital formation" (GFCF), total purchases (or intermediate consumption), including from the industry itself, represent more than four times its value added (VA). In 2013, total purchases came to €43 billion, a boost to many sectors of the economy. Since 2009, however, VA has been fluctuating between around \(€ 10\) billion, well below the more than \(€ 13\) billion recorded between 2000 and 2005. It would appear not to be sufficient to finance both employees' salaries and the gross fixed capital formation (as well as return on capital). The investment rate (the ratio of GFCF to VA), the guarantor of future output in a highly capital-intensive industry, is kept at a high level in this tough period for European automotive markets, whereas the margin rate (the ratio of gross operating surplus to VA) is low (cf. the graph on page 28).

\hline
\end{tabular}
(1) These data are provisional (2) Total purchases (intermediate consumption) refers to the value of goods and services transformed or consumed fully during the production process. The distribution of purchases by industry is expressed by volume. In the new 2010 the research and development costs are no longer included in intermediate consumption, but in GFCF. It does not include the depreciation of fixed production assets, which is recorded in uses of capital employed.
Source: INSEE - National accounts (base 2010).

Of the total purchases of the automotive industry, which represent more than \(80 \%\) of its output, just one quarter is made from the industry itself, the other three quarters being made from other industries.
Intermediate goods accounted for \(40 \%\) of purchases, including metallurgy and metalwork; the metalworking industry remained the leading supplier, accounting for \(17 \%\) of total purchases.

Purchases from manufacturers of machines and equipment (excluding electrical, electronic and IT products) accounted for \(12 \%\) of total purchases in the automotive industry. In the 2010 basis, in which research and development expenditure is accounted for as GFCF, the automotive industry devotes \(14 \%\) of its purchases to the tertiary sector, particularly in the activities of support to companies ( \(7 \%\) ).

OUTPUT OF THE AUTOMOTIVE SECTOR IN 2013

\section*{Automotive OEMS and suppliers}

Automobile manufacturing acts as a structure for its suppliers and the French economy as a whole.
The development of French automotive manufacturing drives the sector of OEMs and other suppliers such as plastic converters, industrial rubber, the casting business, industrial metalworking services, and so on. According to a study by the DGE, the French automotive industry employs 441,000 equivalent full-time" (EFT) employees in the core businesses (manufacturers, equipment makers and body makers) and 230,000 in the periphery. The periphery includes eleven business sectors including glass, textile, rubber and plastic products and metal products.
Automotive OEM suppliers, members of CLIFA, estimate their revenues at more than \(€ 40\) billion in 2014, compared with \(€ 50\) billion in 2007. According to Eurostat, automobile assembly and the French equipment supplying industry each occupy second place in Europe in their respective industries in terms of revenues.

Sources: FIEV, professional organizations. (1) 2012 data.

According to figures published by the FIEV, employees for 2014 in the automotive industry not including manufacturers stood at nearly 230,000, including 74,000 for equipment (FIEV), 63,000 for mechanics (FIM), 34,000 for tires and rubber (SNCP, 2012 figures) and 25,000 for plastics (GPA, 2012 figures). Equipment manufacturers have two types of markets: the first type with a total worth of \(€ 13.3\) billion in 2014, producing equipment for assembly chains, and the second type dealing with spare parts, with a total worth of around € 2.3 billion. In recent years, outsourcing has meant increasing reliance on suppliers, whose services represent a large and growing proportion of the total cost of vehicle manufacture (about three quarters according to the French Automotive Equipment Industries Association - FIEV). The French automotive industry still relies on its French industrial base; the FIEV has estimated the sales of suppliers to the automotive industry to have reached more
than \(€ 40\) billion. It accounts for a major share of the engineered plastics parts business, the industrial rubber markets, the casting business, and industrial metalworking services, which include cutting, stamping, industrial mechanics, machining, forging, drop forging, die forging, and metal coatings. According to the Groupement des Industries de la Sous-Traitance Mécanique (Association of Mechanical Subcontracting Industries - GIST), the automotive industry represents nearly \(40 \%\) of its business in terms of revenue. To show the true scale of the automotive branch, we should add to these automotive suppliers represented by the Comite de Liaison des Fournisseurs de l'Automobile (Automotive Suppliers' Liaison Committee - CLIFA) the business represented, for example, by purchases the automotive industry makes in France from other branches such as steelworks, chemistry or even power generation (see page 58).

\section*{st \\ CUSTOMER}

THE FRENCH AUTOMOTIVE INDUSTRY IS THE LARGEST CUSTOMER OF THE PLASTICS, INDUSTRIAL RUBBER AND INDUSTRIAL METALWORKING SERVICES SECTORS

\section*{Employment}

In the broadest sense, in 2014 the industry provided work for 2.3 million people, representing more than \(9 \%\) of France's employed working population. The automotive industry alone directly employed 226,000 people, representing \(7 \%\) of all employment in the manufacturing and energy sector (including the extractive industries, food industries and industrial companies with fewer than 20 employees). The effects of the financial and economic crisis that started in 2008 were sorely felt in industrial branches and those associated with vehicle use, particularly for heavy trucks, and transport. Following the consolidation of 2011, the fall in employment figures resumed in 2012.

GEOGRAPHIC BREAKDOWN
OF AUTOMOTIVE INDUSTRY EMPLOYEES
ON JANUARY 1 \({ }^{\text {ST }}, 2013\)

As the driving force behind industrial output in France, the automotive industry and its suppliers directly and indirectly created 541,000 jobs either in production or through its purchases from other sectors. It is worth remembering that today, employee figures for the automotive industry do not include temporary positions as they are now included in the purchase of new services. Also, following the change in category (cf. pages 80-81), OEM employees join those working for car seat and electrical equipment manufacturers for engines and vehicles, that previously were included in purchases from manufacturing an energy industries. Vehicle usage provided jobs for more than 640,000 people, particularly in the areas of vehicle-related services (sales, repairs, automotive equipment retailing, etc.), fuel and recycling (oil recovery, car breakers, etc.). These figures concern employees and also individual entrepreneurs and non-salaried employees. Finally, the road transport (passenger and freight) sector and its related infrastructure employed more than one million people. These include both outsourced and in-house transport operations. In a broader sense of freight transport and logistics (storage and related services), the French Transport Ministry's Statistics Department (SESP) carried out a multi-sector analysis that showed there were 1.5 million employees in this sector in 2004. According to INSEE data, as at January 1 \({ }^{\text {st }}, 2013\), the greater Paris region accounted for \(22 \%\) of the personnel of the automotive industry (including manufacturers, equipment manufacturers and bodybuilders). The other major regions for the automotive industry were the Nord-Pas-de-Calais (11\%), Rhône-Alpes and Franche-Comté ( \(9 \%\) each), Alsace and Lorraine ( \(6 \%\) each), Upper and Lower Normandy, as well as Pays de la Loire (around 5\% each).

(1) Including Talbot up to 1985. (2) Renault acquired Dacia in 1999 and Samsung Motors' assets in September 2000. The Renault Trafic II is manufactured by IBC-a General Motors subsidiary-in the United Kingdom and by Nissan in Spain. Since 2006, some Renault Trafic II vehicles have been classified as passenger cars. (3) Between 1990 and 2000, Mack was integrated in Renault V.I. In 2001, the heavy trucks activity of Renault was combined with that of AB Volvo. Renault V.I. was renamed Renault Trucks. (4) On 1st January 1999, Renault V.I. (Renault Trucks) sold its coach and bus business to Irisbus, part of Iveco.

(1) World production of French manufacturers as of 1997. (2) Including Talbot up to 1985.

\section*{Deliveries of French automakers outside France}

Since 1996, exports by French manufacturers include both assembled vehicles and KD/CKD units. Vehicles delivered to French Overseas Departments are no longer counted as exports. Dacia's exports are included in the scope of consolidation as of 2005, the Renault Trafic is included as of 2006, and Renault Samsung Motors as of 2007 ( 180,973 passenger cars). Also, certain exports are sent to regions and not specific countries.

\section*{Physical and financial data for the automobile manufacturing industry}

Physical and financial data are taken from surveys (known as the EAE reports) conducted every year of French companies in the automotive manufacturing industry. Since 2008, they have been replaced by the ESANE information system, combining both survey and administrative data. These statistics are one of the main sources of information for French industry.
The SESSI, formerly the statistics department of the Government Secretariat for Industry now attached to INSEE, uses the surveys. These data reflect the businesses of French and foreign-owned companies with operations in France. Their core businesses may extend to other countries.
Significant variations can occur to the scope of companies from one year to the next, as the result of events such as the creation, reorganization, acquisition or sale. The introduction of a new economic category, the joint use of administrative and survey data (particularly for comparison), and new statistical regulations (decision-makers, etc.) are the cause of a slight reduction in the sector's scope between 2007 and 2008.

(2) Until 2007, these are actual employees: average employee numbers, corrected by the balance of employees hired (temporary staff) and quoted as hired staff.

\section*{Physical and financial data for the automotive equipment manufacturing industry}

The physical and financial data in the table below are taken from surveys (known as the EAE reports) conducted every year of French companies in the automotive equipment manufacturing industry and from 2008, from the new ESANE information system. In 1993, a new French business category (NAF1), standardized throughout the European Union, was put in place. A number of companies were reclassified in the metalworking, electrical equipment and car seating industries, resulting in a statistical break in data. Since 2008, this category has become NAF2, still standardized throughout the European Union: OEM companies, electrical equipment manufacturers for engines and vehicles and car seat manufacturers are now included in this category. Companies listed in the new "automotive equipment manufacturing" sector do not represent, therefore, all suppliers of the automotive industry. Added to these should be manufacturers of glass, tires, doors and locks and automotive springs...
In addition to these activities, the automotive manufacturing and automotive equipment manufacturing industries purchase a number of intermediate products (metals, rubber, plastics, etc.), services (consulting, research, advertising, etc.) and capital goods from other sectors.
