## A WORD FROM THE PRESIDENT

*At the 24-hour Le Mans race, before the end of the Hunaudières section, the key thing is to be ready for the Mulsanne corner... Today, like in that famous race, the global auto industry is getting to the end of a straight line and in spite of a very buoyant business climate, several manufacturers are reporting falling profits. French manufacturers, for their part, are in good shape as they prepare for this cyclical phenomenon, which comes at a time when the challenges they face are of unparalleled proportions.*

More than ever, the automobile meets the world's needs for mobility. The global market for vehicle sales has reached a new record level, at **97 million** units. In 2017, French auto groups sales grew, both in terms of **trading results** and **scope** (Opel-Vauxhall/PSA and AvtoVAZ/Renault). The **renewal** of car bodies with "SUV/Crossovers" proved to be a good bet, as was the idea of introducing light commercial vehicles. Renault Trucks' complete revamp of its heavy trucks range started in 2013 has also been a great success.

However, the industry is heading into turbulence.

Globally, uncertainty as to **international trade** formats, triggered by the Trump Administration, steel and aluminium, customs duty on vehicles and components, Iran and Russia, are certainly weighing heavily on the auto sector. The rules introduced to build a stable structure for trade have been brought into question and today, the risk of protectionism is very real. The European automotive industry is also facing uncertainty due to the lack of clarity on the consequences of **Brexit**.

"The Volkswagen scandal" in the US really **damaged the image** of European cars. The worst affected was the German auto industry, the economic powerhouse on the other side of the Rhine, which was plunged into an unprecedented crisis, revolving mainly around the issues of diesel

and emissions.

**Diesel** has gone into **steep decline**. Triggered by the success of petrol engine models, it was accelerated by fraudulent practices (or suspicions thereof), and then amplified by traffic restrictions. A paradoxical situation given that the diesel emission problem had been resolved with Euro 6d Temp. This loss of trust also impacted the **CO<sub>2</sub> issue**. Right in the middle of the change of accreditation protocol, from the NEDC to the **WLTP**, consumption values have changed with CO<sub>2</sub> levels. This is happening during the review period on European Commission objectives, where unrealistic positions are being discussed for the 2030 horizon. It is crucial that we get real on this topic. Auto manufacturers have always shown their commitment by drastically reducing emissions, but it is the market – and therefore customer choice – that drives performance. The decline in diesel and the sluggish electric vehicle market are leaving a dark cloud of massive financial penalties if European 2020 objectives are not met, thereby weakening manufacturers who have to invest in new technologies.

"**Technological neutrality**" of regulations is a key element: the public authorities have to define realistic targets and industrialists need to find the appropriate technologies to meet them. Thus, the electrification of powertrains does not mean the end of the thermal engine. Its acceptance by customers is dependent upon recharging infrastructure and cost. Imposing technologies puts the European auto industry's R&D knowhow in jeopardy, in particular when they have to face the ambitions of China.

In a buoyant trading climate, French manufacturers increased **production in France**. There has been a 25% increase compared to 2013, i.e. 460,000 additional vehicles. This recovery is linked to the internal efforts of the PSA and Renault groups, with the reorganisation of sites and new company agreements, as well as help from the CICE tax credit. However, the tax burden on production is still too high in France compared to other European countries. The CCFA is working on this competitiveness question with France Industrie and the Medef.

In a dynamic **French market**, the diesel crisis is all too present. Its market share was 47% in the registration of new passenger vehicles in 2017 (40% by mid-2018). This collapse will not be without industrial and human consequences: the automotive industry's Strategy Committee (CSF), along with the State, needs to accompany the identification and reconversion of employment areas of France that are under threat. The increase in CO<sub>2</sub> values, linked to the WLTP accreditation of passenger vehicles on September 1, 2018, needs to be neutralised from a fiscal point of view, but in the time it will take for the legal texts to come through, the market could be disrupted. This comes on top of the burden of French taxation on cars and remains a recurrent negative point for households and for the renewal of the vehicle stock.

This situation, although positive in the short term,

is riddled with uncertainty, French manufacturers will, over the long term, be faced with considerable challenges and investment needs, which, by definition, accompany major automotive revolutions.

**The electrification of engines** is underway. This technology is the major thrust of CSF commitments. There are now more than 20,000 charging stations open to the public in France; and this will increase to 100,000 by 2022, increasing sales of electric and rechargeable hybrid vehicles fivefold.

France has made the **autonomous vehicle** a major industrial programme. PSA and Renault groups, very much involved in this process, share this experience under the CSF umbrella. The public authorities have drawn up a roadmap to facilitate the testing of autonomous vehicles in France. In the **digital** field, the public authorities also need to assess the challenges involved in data sharing amongst vehicles and understand the manufacturer's role as an architect, which is inseparable from that of guardian of its customers' data. The "**extended vehicle**" constitutes an international standard developed by the French automotive industry, encompassing the vehicle and off-board servers. It has found its legal translation within the CSF framework.

*Today, French manufacturers are making the most of the buoyant auto cycle, but remain vigilant as to the medium to long-term challenges they face. The public authorities have to ensure that the conditions are right to solve problems and guide them in the right direction. Consolidated in their traditional professions, the French manufacturers are fully committed to the "new automobile frontier" with the connected, autonomous vehicle and digital services.*

*French manufacturers are sticking to their race plan...*

*Enjoy the read!*  
**Christian PEUGEOT**

## THE FRENCH AUTOMOBILE MANUFACTURERS' ASSOCIATION

The Comité des Constructeurs Français d'Automobiles (CCFA) is the French automobile manufacturers' trade association. Its members are: Alpine, PSA (Automobiles Citroën – Automobiles Peugeot), Renault and Renault Trucks. Its mission is to study and defend the business and industrial interests of all French automobile manufacturers on both national and international levels (excluding labor issues which are the remit of the UIMM – the union of specialties and metallurgical industries).

CCFA's activities include information, analysis and communication for its members as well as for government agencies, public officials, members of parliament, the manufacturing sector, the automotive and road industry, research bodies, the media and the general public.

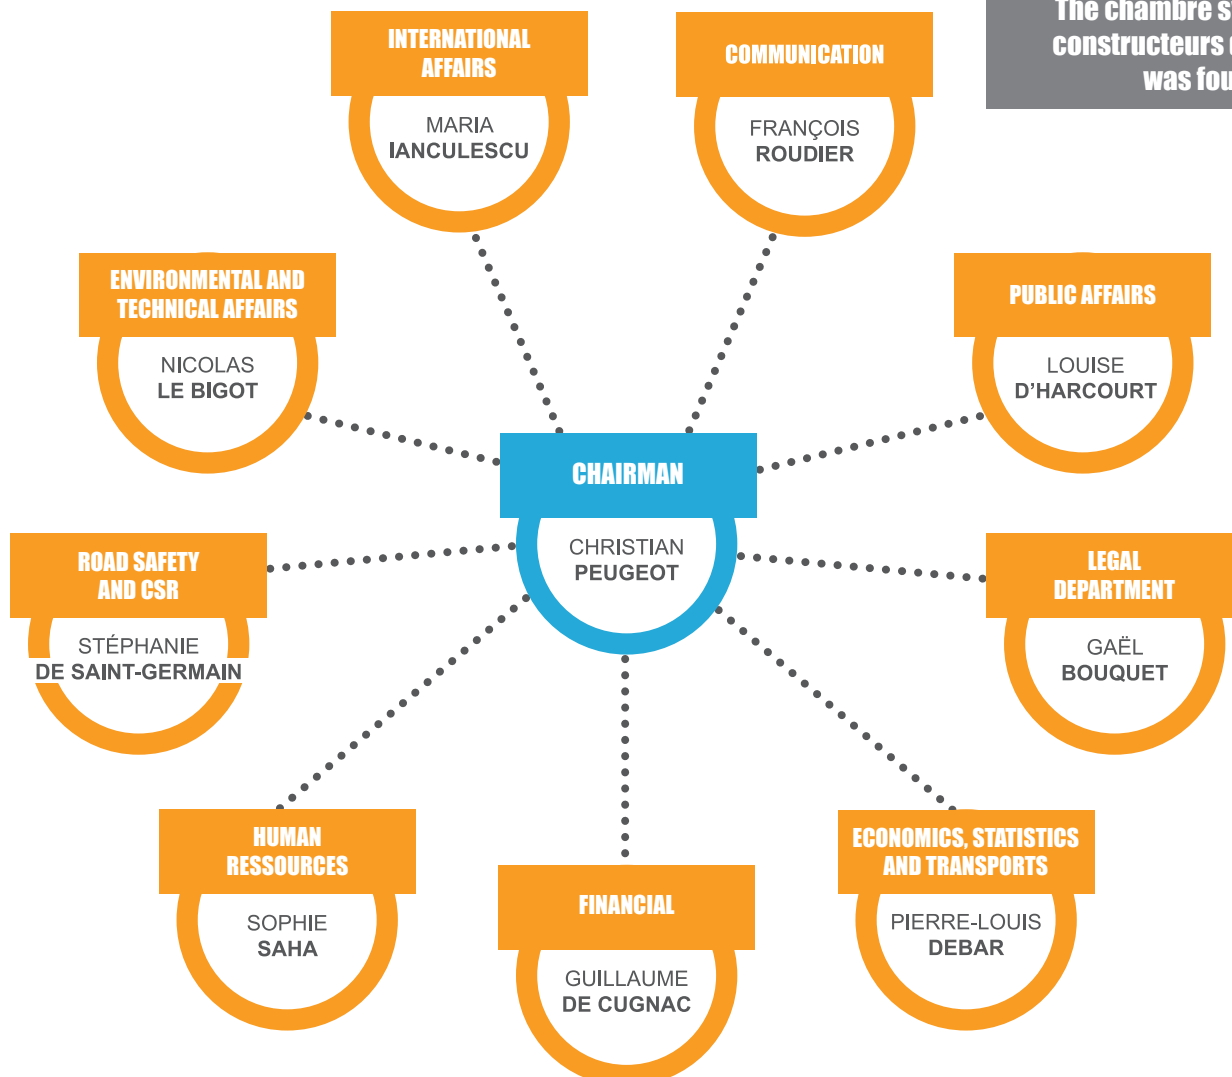

Other sectors of the automotive industry (parts and equipment manufacturers, dealers, body manufacturers) have their own trade associations (FIEV, Fédération des Industries des Équipements pour Véhicules - French Automotive Equipment Industries Association, CNPA, Conseil National des Professions de l'Automobile - National Council of Automotive Professions, FFC, Fédération Française de Carrosserie - French Bodybuilding Federation, FIEEC, Fédération des Industries Electriques, Electroniques et Communication -

Electrical, Electronic and Communications Industry Federation, FIM, Fédération des Industries Mécaniques - Mechanical Industry Federation, GPA, Groupement Plasturgie Automobile - Automotive Plastics Group, SNCP, Syndicat National du Caoutchouc et des Polymères - National Union of Polymers and Rubber Industries, etc.). In 2009, during the crisis, French automobile manufacturers and their suppliers came together within the Liaison Committee of Automotive Suppliers (CLIFA - Comité de Liaison des Fournisseurs de l'Automobile) to establish the PFA, French Automotive & Mobility Cluster, which has the task of contributing to reinforcing the French automotive industry. In 2012, the Automotive Technical Committee (CTA - Comité Technique Automobile) with its two boards, the Automotive Technical Standardisation Council (CSTA - Conseil de Standardisation Technique Automobile) and the Automotive Research Council (CRA - Conseil de Recherche Automobile), which role is to guide research and development, were created. At the end of 2017, PFA entered into a new phase with the following missions: boosting the innovation dynamic, competitiveness initiatives right through the industry, planning ahead for employment and skill requirements, expressing joint positions for the industry, coordination and organisation of professional shows and

communications throughout the industry.

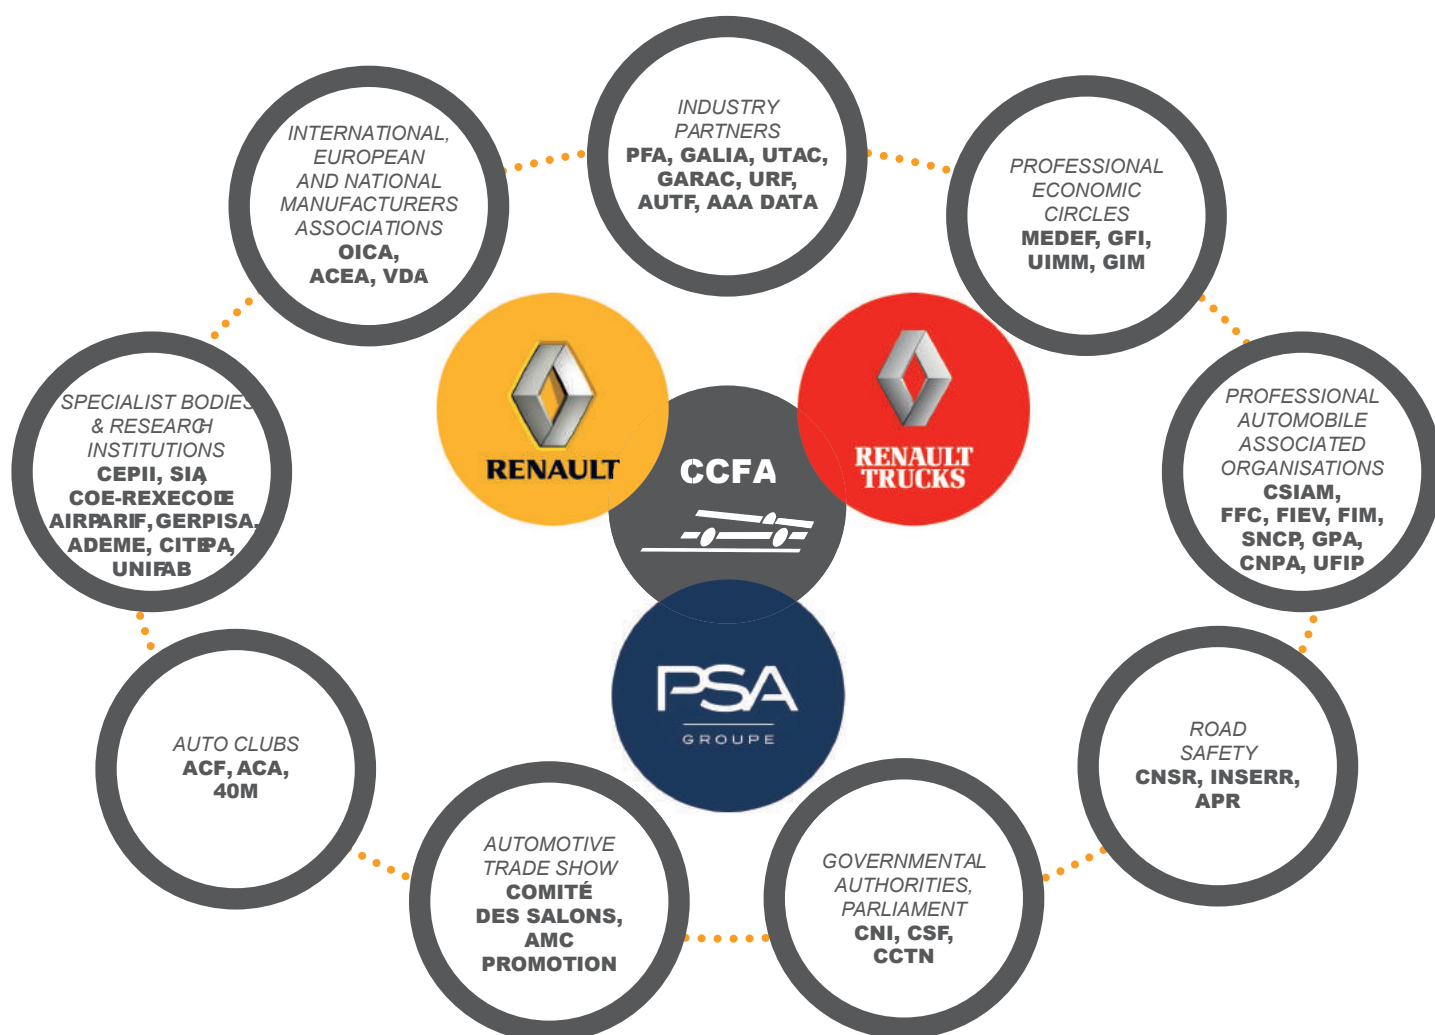

Foreign brands are represented by the Chambre Syndicale Internationale de l'Automobile et du Motorcycle (CSIAM - International Association of the Automobile and the Motorcycle). CCFA is associated with Brussels-based ACEA, the European Automobile Manufacturers' Association.

It is also a member of the OICA, Organisation Internationale des constructeurs de l'automobile (OICA - International Organisation of Motor Vehicle Manufacturers, which brings together national associations representing the industry from around the world.

**ACEA:** European Automobile Manufacturers' Association

**VDA:** Verband der Automobilindustrie

### ► INDUSTRY PARTNERS

**PFA:** French Automotive & Mobility Cluster

**GALIA:** Groupement pour l'Amélioration des Liaisons dans l'Automobile

**UTAC:** Union Technique de l'Automobile, du Motorcycle et du Cycle

**GARAC:** Ecole Nationale des Professions de l'Automobile

**URF:** Union Routière de France

**AUTF:** Association des Utilisateurs de Transport de Fret

### ► SPECIALIST BODIES & RESEARCH INSTITUTIONS

**CEPII:** Centre d'Etudes Prospectives et d'Informations Internationales

**SIA:** Société des Ingénieurs de l'Automobile

**AIRPARIF:** Association de surveillance de la qualité de l'air en Ile-de-France

**GERPISA:** Groupe d'Etudes et de Recherches Permanents sur l'Industrie et les Salariés de l'Automobile

**UNIFAB:** Union des Fabricants pour la protection internationale de la propriété intellectuelle

**ADEME:** Agence de l'Environnement et de la Maîtrise de l'Energie

**CITEPA:** Centre Interprofessionnel Technique d'Etudes de la Pollution Atmosphérique

**COE-Rexecode:** Centre d'observation économique et de Recherche pour l'Expansion de l'économie et le Développement des Entreprises

### ► AUTO CLUBS

**ACF:** Automobile Club de France

**ACA:** Automobile Club Association

**40M:** 40 millions d'Automobilistes

### ► GOVERNMENTAL AUTHORITIES, PARLIAMENT

**CNI:** Conseil National de l'Industrie

**CSF:** Comité Stratégique de Filière

**CCTN:** French National Transport Accounting Commission

### ► PROFESSIONAL ECONOMIC CIRCLES

**MEDEF:** Mouvement des Entreprises de France (Employers' association)

**GFI:** Groupe des Fédérations Industrielles (Industrial employers' association)

**UIMM:** Union des Industries et Métiers de la Métallurgie (Metallurgy employers' association)

**GIM:** Groupe des Industries Métallurgiques de

la Région Parisienne (Paris region metallurgical industries group)

### ► PROFESSIONAL AUTOMOBILE ASSOCIATED ORGANISATIONS

**CSIAM:** Chambre Syndicale Internationale de l'Automobile et du Motorcycle

**FFC:** Fédération Française de la Carrosserie

**FIEV:** Fédération des Industries d'Equipements pour Véhicules (French Automotive Equipment Industries Association)

**FIM:** Fédération des Industries Mécaniques (Federation of Mechanical Industries)

**SNCP:** Syndicat National du Caoutchouc et des Polymères (National Union of Rubber and Polymer Workers)

**GPA:** Groupement Plasturgie Automobile (Automotive Plastic Converters Association)

**CNPA:** Conseil National des Professions de l'Automobile (National Council of Automotive Professions)

**UFIP:** Union Française des Industries Pétrolières

### ► ROAD SAFETY

**CNSR:** Conseil National de la Sécurité Routière (National Road Safety Council)

**INSERR:** Institut National de la Sécurité Routière et de Recherches (National Institute of Road Safety and Research)

**APR:** Association Prévention Routière (National Council of Automotive Professions)

## EUROPEAN MARKET AT THE HIGHEST LEVEL SINCE THE CRISIS: A SOLID PILLAR FOR FRENCH GROUPS

The European markets, which had fallen to very low levels during the financial crisis, continued the recovery begun in 2014, offering French groups the possibility of clawing back substantial additional volumes. The diversification of markets outside Europe brought new opportunities for

French groups (China, India, Turkey) and limited the impact of violent financial crises in other emerging markets before their recoveries (Brazil, Russia, etc.). Lada joined Renault Group on January 1, 2017 and Opel joined PSA Group on August 1, 2017. Globally, since 2014, turnover

growth for French groups has been robust and their share in the global auto manufacturing market grew with their extended scope in 2017

Heavy trucks	27	35	23	25	8.0%	-27.9%

In 2017, global production of French groups' light vehicles reached a new record level. It is up about 30% compared to 2007, in a global economic context marked by the continuation of significant growth in emerging countries until 2013 and the recovery of European markets since 2014. Their production has grown by 9% in France and 20% outside France compared to 2016. To face the challenges of competitiveness of their factories, internationalisation, environment and digital, the groups significantly increase their investments (+63% between 2014 and 2017).

In France, road traffic has grown since 2012 at a more sustained pace (+1.5% on average). The key factors have been more dynamic economic growth and lower fuel prices until 2016. Automotive expenditure now represents 9% of household expenditure compared to almost 11% in 1990. However, the vehicle purchase item is recovering

because of buoyant sales in the new car market featuring advanced technologies to adhere to new environmental standards. These factors contribute to the renewal of the vehicles in use. Both for passenger cars and commercial vehicles, renewal trends are more efficient and more virtuous. In 2017, consumption of fuel in France was close to that observed at the beginning of the 2000s, whilst total traffic has increased by 17%.

## A STILL DYNAMIC GLOBAL AUTOMOTIVE MARKET ONCE AGAIN OFFERS GROWTH OPPORTUNITIES TO FRENCH GROUPS THAT CONTINUE TO EXPAND THEIR SITES

The weight of French groups in the global production of vehicles amounted to 8% in 2017, one point more than in 2016 and 1.7 points more than in 2014.

	Units	2016	2017	Change 2017/2016
<b>Market share of French groups (new light vehicles)</b>				
In France	%	55.2%	56.3%	1.1 point
In Europe (17 countries) excluding France	%	15.6%	18.4%	2.8 point
In Europe (17 countries)	%	21.7%	24.4%	2.7 point
<b>Market share of French brands (new heavy trucks)</b>				
In Europe (17 countries)	%	7.9%	8.4%	0.5 point
<b>French groups' share in world production (PSA and Renault Groups)</b>				
Passenger cars share	%	8.0%	9.4%	1.4 point
Commercial vehicles	%	3.9%	3.8%	-0.1 point

Total jobs (directly and indirectly related)	thousands of people	2,182	2,190	
As a % of the employed working population	%	8%	8%	

In 2017, in Western Europe, markets for new vehicles once again grew thanks in particular to the continued recovery of the Italian and Spanish markets and despite the decline in the UK market. In a context which nevertheless remains highly competitive, this has led to a growth of market share of French groups which have integrated new brands (a share of 18.4% in 2017 compared to 14.7% in 2013) in that zone (excluding France). The share of European sales as a proportion of all French groups' sales will not last, because of auto-density variations between this mature zone and the emerging countries. Indeed, they produced around 60% in their zone of origin in 2017, compared to 80% in 2006.

In Eastern Europe, the markets progressed in the member countries of the European Union and recovered in Russia. The robustness of the growth of sales in China, which became the biggest automotive market in the world in 2009, explains the overall growth of the Asian market.

The exports of the French groups, 1.5 million vehicles in 2017, have again increased in Asia (+8%), thanks in particular to the Iranian market.

In Latin America, the markets recovered and the

impact was reflected in sales by French groups. Their deliveries of passenger cars rebounded by 13% in 2017 (+18% in Argentina and +10% in Brazil), after several years of decline due to the sharp decline in local markets.

Finally, the exports of French groups continue to shrink in Africa and reach 213,000 vehicles, in a market still in sharp decline. In the Maghreb, where they are present including in terms of production plants, Algeria (-5%) has seen a decline, unlike Morocco (+4%).

In the emerging countries, where sales should grow longer term, French groups continued to develop both commercially and industrially, with or without partnerships, so as to satisfy growing vehicle needs. They have decided on new investments and to renew and adapt their vehicle ranges. In particular they continue their efforts in Asia (PSA, with its partners in China and in India, and Renault in the same countries) and in different countries of Africa.

## WORLD VEHICLE PRODUCTION

In 2017, global vehicle production increased by 2.4% to 97.4 million, i.e. 2.3 million additional units. It has reported continuous growth since the 2009 collapse. Asia and Africa grew 3%, Western Europe 1%. South America (+20%) and Eastern Europe (+7%) progressed strongly. Growth was more dynamic in emerging zones than in mature markets.

Global production of vehicles was around 50 million units in 1990, and then around 60 million in 2000. It crossed the 70 million threshold pre-crisis, before collapsing in 2009. In 2012 and 2015, production reached 80 and 90 million units respectively. Since 2000, the annual growth rate has been 3% on average.

In mature zones, production trends compared to 2007 levels are divergent; decline in Western Europe (-12%) and Japan (-16%), but 13% growth in NAFTA (Canada, US, Mexico) and 1% in South Korea.

In emerging zones and countries, including Asia, today's automotive expansion segment, production is far higher than before the crisis. In 2017, compared to 2007, it was 227% higher in China, +196% in Indonesia, +95% in the Philippines and +54% in Thailand.

In thousands	2016	2017	Change %
<b>EUROPE</b>	<b>21,490</b>	<b>22,200</b>	<b>3.3</b>

(2) ASEAN: Brunei, Cambodia, Indonesia, Laos, Malaysia, Myanmar, Philippines, Singapore, Thailand, Vietnam.

Sources: OICA - CCFA estimates June 2018

### CHANGES IN WORLD MOTOR VEHICLE PRODUCTION SINCE 2000

In Western Europe, production increased 1% in 2017 compared to the previous year with contrasting results. Countries like Portugal (+23%), Sweden (+10%), France (+7%), Italy (+4%) progressed, whilst others such as Germany (-2%) and Spain (-1%) declined. In Eastern Europe, production in Russia recovered (+5%).

In America, production fell in NAFTA (-4%) but recovered in South America (+20%) after the sharp decline observed previously (-42% between 2014 and 2016).

As for Asia-Oceania, which represents more than half of global output, production progressed in Iran

(+18%), in Indonesia and in China (+3%). It also increased in Japan (+5%) but fell back in South Korea for the second consecutive year (-3%).

## WORLD VEHICLE PRODUCTION

Between 2010 and 2017, global production of vehicles (95.3 million) increased 25% i.e. by 19.7 million units. Since 2010, the global automotive industry has remained dynamic overall, except in South America and South Korea.

In mature zones and countries, production increased by almost 6 million vehicles since 2010 to 46 million units (+15%). They represented less than half of global production in 2017, compared to 51% in 2010. Within those zones, production in North America increased by 5.3 million units (+43%) thanks to Mexico, in particular, whilst in Western Europe, it increased by 900,000 (+7%). Japan's production is almost stable (i.e. +1%

compared to 2010). However, that of South Korea decreases by 4%.

In emerging countries and zones, production increased by 13 million vehicles, based on the five following areas:

- China (+10.8 million), which represented 30% of global production in 2017, compared to 24% in 2010 ;
- Central and Eastern Europe and Turkey (+1.4 million units and a share of 8%, i.e. the same level as in 2010) ;
- Indonesia, Iran, Malaysia and Thailand (+710,000 units and a share of 5%, compared to 6% in 2010) ;

- South America (-1 million units and a share of 3%, compared to 6% in 2010) ;
- India (+1.2 million units and a share of 5%, i.e. the same level as 2010).

In Central and Eastern Europe, the vigour demonstrated by the new member states of the European Union contrasts with the severe decline in production in Russia, with 1.6 million vehicles in 2016 (-31% compared to its highest level in 2012).

### MATURE REGIONS AND COUNTRIES

### EMERGING REGIONS AND COUNTRIES

### MARKETS OF FRENCH GROUPS OUT EU-17: ALL VEHICLES

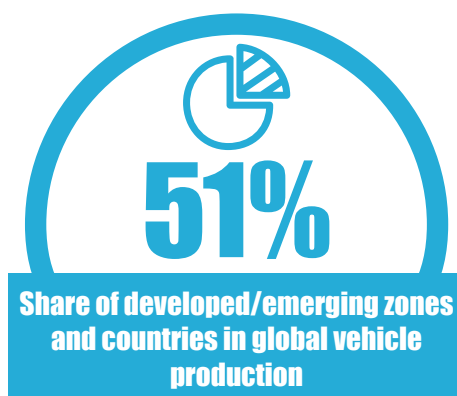

### WORLD MARKETS OF FRENCH GROUPS: EVOLUTION COMPARED WITH 1997

In this context of dynamic growth of global production, French groups have substantially bolstered their deliveries to emerging areas. After a growth between 2000 and 2008, deliveries outside the 17 countries of the European Union had dipped in 2009 and then recovered substantially over the following years. In 2017, they integrate the volumes of the Lada and Opel brands, belonging respectively to the Renault Group since January 1, 2017 and to the PSA Group from August 1, 2017.

They increased compared to 2010, except in Latin America, including Mexico (-28,000 units). Hence, deliveries were up in the countries of Central and Eastern Europe and Turkey (+461,000 units), in Asia (+340,000 units) and in Africa (+13,000 units). In Europe, deliveries to Spain and Italy continued to grow (respectively +116,000 and +147,000 units since 2010) after a downturn caused by the global crisis.

## WORLD RANKING OF AUTOMOBILE MANUFACTURERS

8%

**Market share of French groups in world automobile production in 2017**

The 10 biggest manufacturers, including French groups PSA and Renault, represented around 70% of global production. Each produced over 3.5 million vehicles.

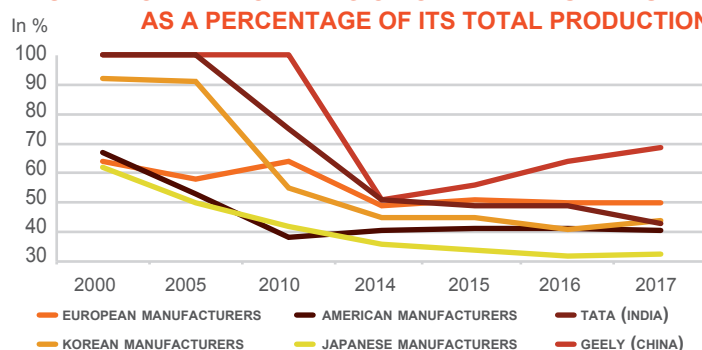

In 2017, French groups benefitted in volume terms from the continued growth of the European market and the integration of Lada into the Renault Group on January 1, 2017 and Opel into the PSA group on August 1, 2017; they ranked respectively ninth and tenth in the world. French group production accounted for 8% of world production, higher than in 2013 and 2014 (6%).

Car manufacturers have become substantially internationalised since 2000 and continue to develop industrial facilities outside their home countries. European, American, Japanese and Korean manufacturers produced between 60 and 70% of their vehicles in their own areas in 2000, compared to 30-50% in 2017. Japanese manufacturers were the most internationalised (they only made 33% of their vehicles in Japan), followed by the Koreans (44% in Korea). Even emerging countries manufacturers, Geely and Tata, made a large part of their production outside their home countries (31 and 57% respectively).

### ► WORLD VEHICLES PRODUCTION IN 2017 (1) (IN THOUSANDS)

Rank	Group	2016	2017	Change %
1	VOLKSWAGEN	10,312	10,590	2.7
2	TOYOTA	10,213	10,466	2.5

### SHARE OF THE HOME REGION OF THE MANUFACTURER AS A PERCENTAGE OF ITS TOTAL PRODUCTION

Note: The production of Chinese manufacturers does not include joint-ventures.

(1) The vehicles include passenger cars, light commercial vehicles, heavy trucks, and coaches and buses. There may be double counts between manufacturers.

(2) The output of GM and Ford include their activities in China.

Sources: OICA, CCFA estimates July 2018

In a context of dynamic growth, global production however increased by 2% with contrasting results from one group to another.

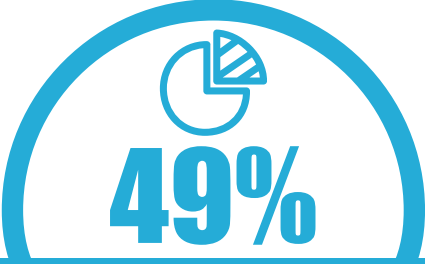

The Volkswagen group (+3%), which has a very high profile in emerging countries, kept its n° 1 ranking in 2017. The Toyota group, once again second-biggest global manufacturer having occupied the top spot for 10 years, saw production increase (+2%). That of GM also increased (+5%) whilst Ford reported a decline (-1%).

Amongst the Japanese manufacturers, the situation is globally positive. Hyundai-Kia (-9%/4<sup>th</sup> ranking), Nissan (+4%/6<sup>th</sup> ranking), Honda (+5%/7<sup>th</sup> ranking) protected their rankings. Suzuki-Maruti (+12%/11<sup>th</sup> rank) improved their ranking.

The European groups increased production: generalist manufacturers Renault (+23%), PSA (+16 %), and specialist German groups making higher-end vehicles: BMW (+6%), Daimler (+3%). On the other hand, Fiat continued its decline (-2%).

Emerging country manufacturers (China, India) also reported buoyant growth. The production of SAIC, the biggest Chinese group, increased (+12%), as did that of Dongfeng (+10%), whilst Tata group production grew only slightly (+1%).

# TRENDS IN PRODUCTION AND TRADE AMONG THE WORLD'S LEADING AUTOMOTIVE REGIONS

**49%**

**Percentage of vehicles manufactured for export in Japan in 2017**

China, which became the largest manufacturer in the world in 2010, manufactures primarily to satisfy its domestic market: imports (+16% at 1.2 million vehicles) and exports (+31% at 1.1 million units), each represent less than 5% of production.

The European Union (now 28 countries) is the second world's leading production area thanks to the net growth in the domestic market and buoyant exports (1/3 of production).

In North America, including Mexico, production decreased (-4%), but remains at a high level.

Production is primarily for the local market, with exports only accounting for 12%. Imports, on the other hand, represent 29% of production.

In Japan, exports account for 50% of production, which increased 1% since 2010. Imports still account for around 6% of total registrations

## ► CHINA ALL VEHICLES

Sources: OICA, CAAM

	Production		Exports		Imports	
	In thousands	Index (100=2010)	In thousands	Share of production	In thousands	Share of production
2010	18,265	100	499	3%	-	-
2015	24,567	135	755	3%	1,103	4%
2016	28,119	154	810	3%	1,077	4%
2017	29,015	159	1,064	4%	1,247	4%

Since 2000, the trends in the three major automotive industry zones have been contrasted.

In the European Union (now 28 countries), growth of vehicle production was 10% versus 2000 (compared to +15% in 2007 versus 2000) and trade, already buoyant, more than doubled.

In North America, including Mexico, since 2009, production exceeded 2000 output by 11%. Imports, already very high in 2000, and sustained since, exceeded 2000 levels by 60%. Exports only represented 12% of production (1/3 for the EU

and 1/2 for Japan) with a very high weight for passenger cars (31% versus 3% for commercial vehicles). As for imports, the imbalance between these two categories of vehicles is much lower.

Finally in Japan, vehicle output remained stable because of the decline in the domestic market and slow export growth, initially boosted in line with the depreciation of the yen, at a level of 51% above 2000 figures by 2008. In 2015, exports were only 4% higher, primarily because Japanese manufacturers are manufacturing outside Japan.

Finally, in Japan, vehicle production rose by 5% in both the domestic and export markets. The latter had increased significantly, in line with the depreciation of the yen, and they exceeded in 2008 by 51% the level of 2000; in 2016, they were only 6% higher, mainly due to the production of factories of Japanese manufacturers outside Japan.

In China, production and exports have increased substantially since 2010, with respective gains of 59% and 113%.

## WORLD VEHICLE MARKETS

In 2017, the global automotive market continued to grow strongly (+3.1% to 96.8 million vehicles), setting a new record for the eighth consecutive year. Registrations increased in all areas except Africa.

The world's five leading markets (China, USA, Japan, Germany, India) accounted for 60% of global sales. In 2005, China and India ranked third and twelfth, respectively. In 2017, sales in China out-paced those in all other continents taken separately (including Asia excluding China).

Automotive markets are strongly correlated to the economic situation, with cyclical phenomena mostly reflecting those trends. They are also characterised by substantial short-term fluctuations, both for renewals and first purchases.

The share of the global market of the main industrialised zones, where car ownership rates have arrived at maturity, was 46% in 2017, compared to 69% in 2005. But volumes still evolve around 45 million units.

In emerging markets, market trends are generally been downward, despite rebounds in 2017, compared to previously higher levels. Since 2012, sales in Russia and Brazil have fallen respectively by 49% and 41%. The Algerian market lost almost 2/3 compared to its high point in 2013.

(2) ASEAN: Brunei, Cambodia, Indonesia, Laos, Malaysia, Myanmar, Philippines, Singapore, Thailand, Vietnam.

Source: OICA

In the US, the market decreased at around 17.6 million vehicles in 2016. It has nevertheless remained at a very high level. The market grew by 7 million units compared to its low cycle level of 2009 (10.6 million). The Mexican market fell by 5% to 1.6 million units.

Western Europe continues its recovery observed in 2014 to settle at 16.6 million vehicles. This level is still below the record observed in 2007 (17.3 million units). In 2013, the lowest point of the cycle, they reported 13.2 million units. The variations per country, symbolising the diversity of cycles observed in national European markets are disparate but nevertheless positive with the exception of the markets in the United Kingdom (-5%), Ireland (-10%) and Denmark (-1%). Otherwise, growth rates range from +2% for Norway to +16% for Iceland and +8% for the Netherlands. The Spanish and Italian markets, which had been hard hit by the crisis, have risen by 76% and 54% respectively since 2013.

Central and Eastern Europe continued its recovery started in 2016 (+9%) after three years of decline. The evolution remains nevertheless contrasted. Growth rates in the markets of the new member states of the European Union was +11%, an increase of 69% since 2012. The Russian markets increased from -42% in 2015 to +14% in 2017 and Ukrainian, from -51% to +26%, regain their dynamism.

In China, in spite of the limitations on the number of new vehicles in major cities, the market grew by 4% to 29 million vehicles. China, which became the largest market in 2009, remains the engine room of global growth, with 30% of vehicles sold.

In Japan, the market recovered by 2%, after two years of decline, amounting to 5.2 million vehicles. Registrations in South Korea have been relatively stable around 1.8 million units since 2015.

In Asia-Oceania, excluding China, Japan and South Korea, the market has fluctuated around 12 million vehicles since 2012. The changes have been very contrasting: up 14% in Thailand and 19% in Iran, a relative stability in Indonesia, but down 16% in Saudi Arabia.

In South America, after a 35% fall in three years, the market recovered (+12%) in 2017, like the first continental market, Brazil (+9%) and also Argentina (+27%).

In Africa, the markets have again strongly decreased (-9%): the trend gap observed in recent years between Algeria and Morocco continues but at a slower pace, with respectively -5% and +4%.

## WORLD'S VEHICLES IN USE

In 2015, the global vehicle stock (passenger and commercial vehicles) was 1.3 billion units (of which over 75% passenger cars), i.e. a growth of 4% compared to the previous year. The average rate of growth since 2011 is 4%, i.e. a faster pace of growth than before the crisis (average growth of +3% between 2007 and 2009).

Stocks were practically stable in the mature markets of developed countries (increases generally between 0 and 2%) and showed strong growth in emerging countries (between 3% and 12%).

The US stock is the biggest in the world with almost 264 million vehicles, ahead of China and Japan (163 and 77 million units respectively). France is in eighth position worldwide (39 million vehicles), behind Italy.

Automobile density across the world was on average 182 vehicles per 1000 inhabitants (+27% compared to 2005). However, the gap is large between 42 vehicles in Africa and 670 in the NAFTA zone (USA, Canada, Mexico) via 85 in Asia (excluding Japan and South Korea), 176 in Central and South America and over 500 for the EU and Japan/South Korea. Density in Europe overall is slightly above 471.

North Africa (Algeria, Egypt, Libya, Morocco and Tunisia), which is close to Europe, has shown strong vehicle stock growth with an average rate of 6% per year since 2005, from 10 to 19 million units.

### VEHICLE DENSITY BY REGION (NUMBER OF CARS AND VEHICLES PER 1,000 INHABITANTS)

(1) NAFTA: Canada, USA and Mexico.

(2) ASEAN: Brunei, Cambodia, Indonesia, Laos, Malaysia, Myanmar, Philippines, Singapore, Thailand, Vietnam.  
Source: OICA

In 2015, the mature zones represented more than 50% of the global vehicle stock and 15% of global production. They have lost around 15 percentage points to the emerging areas since 2005.

Within the European zone, accounting for almost one third of the global stock, the increase was quicker in the east than in the west (see page 19). The number of vehicles per 1,000 inhabitants is also contrasted, ranging from 166 in Albania to 796 in Iceland, via 308 in Romania, and 550-600 in the main countries of Western Europe. The number of vehicles in the zone has grown by almost 65 million units since 2005, of which 73% outside Western Europe (+20 million additional units in Russia).

In the Americas, NAFTA, with 25% of the global stock, is a mature market with a high level of car ownership, especially in the US (821). Mexico has the highest progression in terms of number of vehicles (+4% between 2010 and 2015). However, Central and South America is an emerging zone which accounted for 7% of the global car market in 2015, with a density ratio of 176. The number of vehicles in America has swelled by 86 million units since 2005, almost at the same pace as NAFTA and Central and South America. The three countries with the highest progression in terms of number of vehicles are the US, Brazil and Mexico with 26, 20 and 16 million units respectively.

In Asia, Japan and Korea (8% of the global stock),

which are mature markets, have car ownership levels of 609 and 417 respectively. However, emerging countries with bigger populations have lower automobile density: 22 in India, 87 in Indonesia and 118 in China. Since 2005, almost all of the vehicle stock growth has come from Asia, excluding Japan and South Korea. China (131 million additional units) is way ahead of India (+19 million) and Indonesia (+13 million).

## WORLD TRADE IN AUTOMOTIVE PRODUCTS

Global trading in auto products is particularly influenced by multilateral agreements under the auspices of the WTO and increasingly, bilateral or regional agreements which are signed between different geographical areas.

According to the WTO, in 2016, global trading in automotive industry products decreased by 3%, to \$1,362 billion, 11% above the 2008 level.

In 2016, global trade in auto industry products accounted for 9% of global merchandise exports and 12% of manufactured products.

2016 was marked by the stability of the euro against the dollar, whilst the yen-dollar exchange rate fell 12%.

Faced with higher market activity in NAFTA and the European Union, the share of interregional

trade in global trade has stabilised at around 60% since 2011, compared to 66% in 2009. In NAFTA, Europe (excluding CIS) and South America, this share slipped to 75% (after several years above 80% in the latter region). However, it reached barely 30% in Asia-Oceania, whose focus lies very much outside its zone with national markets that are not so open (Japan, etc.).

Auto sales balances were positive in the European Union (+\$142 billion), Japan (+\$124 billion) and South Korea (+\$50 billion). However, there was a big – indeed record – deficit in the United States (-\$168 billion). China's balance deficit was high too (-\$27 billion).

The European Union (\$682 billion), NAFTA (288 billion dollars), Japan (\$145 billion) and South Korea (\$65 billion) were major exporters. Chinese exports have increased over recent years but are

at a lower level (\$48 billion).

Excluding intra-zone trade, imports from the European Union exceeded those from China, contrary to previous years (\$81 vs. 75 billion in 2016). These imports are however well below those of NAFTA, which rose to a new record level (\$189 billion).

# 4%

France's share of global automotive industry product trading in 2016

(1) For the comparisons, 15 EU countries have been included since 1993, 25 since 2004, 27 since 2006 and 28 since 2014.

Between 2005 and 2016, trends in auto industry balances were very variable between countries and between zones. South Korea's surplus increased from \$34 to 50 billion, Japan's from \$110 to 124 billion, and the European Union's from \$80 to 142 billion. With a slightly higher auto market level than that observed during the record year of 2005, the United States' deficit grew still further (-\$168 billion).

On the other hand, Canada's +\$9 billion surplus in 2005 has turned into a \$5 billion deficit, down to the role taken by Mexico in trading within NAFTA. Mexico reported surplus of \$51 billion, compared to 2 billion in 2007. The \$7 billion surplus also resulted in a slightly positive balance for Brazil. China, which in the meantime has become the biggest auto market in the world, has seen its surplus rise from \$4 to 27 billion.

India's surplus increased from 1 to over \$7 billion, further to a sharp increase in exports, from \$3 billion to over 12 billion.

In 2016, Germany, at \$279 billion, remained the biggest automotive industry exporting country with a market share of 20% compared to 18% in 2008.

Second globally, Japan exported \$145 billion, \$55 billion of which to North America (i.e. 38% of their total exports, compared to more than 50% at the

beginning of the 2000s). Its exports to China fell between 2011 and 2016 to \$12.6 billion. This can usefully be compared to the \$17 billion of exports to EU28.

Exports from the 28 countries of the European Union reached \$682 billion, 67% of which in intracommunity trade (73% in 2009). EU-to-China exports totalled €35 billion. They reached \$8 billion to Russia, \$16 billion to Africa and \$13 billion to the Middle East.

According to Eurostat data, more than half of exports from the EU to outside the EU were from Germany (52% in 2017), ahead of the UK (12%), Italy, Spain and France (around 5% each for those three countries). The share of the six new entrants (Hungary, Poland, Romania, Slovakia and Slovenia) was cumulatively 9%.

France represented 4% of global exports with \$59 billion (including intra-EU trade), compared to almost 8% in 2004.

The US were still the biggest global importer of automotive products, at \$295 billion; due in particular to the buoyancy of its domestic market, its deficit in automotive products hit a new high of \$168 billion, i.e. higher than the \$120 billion observed between 2004 and 2006.

Chinese imports recovered in 2016 (+3% to \$75 billion). Since 2005, they had increased 17% per year. In 2012, the origins of those imports were the EU28 (56% compared to 42% in 2009), ahead of Japan (22% compared to 36% in 2009), NAFTA (13%) and South Korea (7%).

Reflecting oil resources trends, imports have grown substantially since 2005 in Russia, Saudi Arabia and the United Arab Emirates. They progressed at an annual average of 4%, 7% and 9% respectively. But, in Russia, they were divided by 2 compared to 2014 (\$16 billion). They amounted to \$25 and 20 billion respectively in Australia and Saudi Arabia.

The depressed domestic British market was characterised by a drop in imports, but their automotive balance was once again negative.

## NEW PASSENGER CAR REGISTRATIONS PER COUNTRY

**+24%**

**Increase of the new passenger car market in Western Europe since 2013**

The West European market, i.e. 90% of the European market, grew for the fourth year running (+2.5% to 14.3 million units). It has grown by 24% since 2013, i.e. 2.6 million additional units. This increase partially made up for the decline during the years of the crisis (-3.3 million cars between 2007 and 2013). The current level is 3% down on 2007.

In 2017, developments in Western Europe have been contrasting by country. But among the major markets, only the United Kingdom has suffered a drop (-6%) after a record year in 2016. Ireland has also experienced a sharp decline (-10%). Other markets (Switzerland, Denmark and Finland) have decreased, but slightly, and thus remain at high

levels. Germany and France are still at the top of the cycle.

Southern European countries (Spain, Italy, Portugal and Greece) continued to grow after the low point of 2013 (+8%). These markets grew by 60% over this period but are still down by 23% compared to 2007.

In millions of units

In millions of units

In thousands of units

In thousands of units

In thousands of units

As a % of Western Europe market

The West European market comprises 18 countries (15 pre-2004 EU members, plus European Free Trade Association - EFTA countries: Switzerland, Norway and Iceland). These countries have similar environments and obey similar economic rules.

The market went through two major crises: in

1993, i.e. -16% to 2.2 million units, and from the end of 2008. The latter resulted in a decline of 22% between 2007 and 2013, i.e. -3.3 million units with considerable variations from one geographical zone to another. Northern Europe (cf. definition of the graph above, plus Germany and the UK) suffered a fall of 5% during the crisis compared to more than

50% for Southern Europe (Spain, Italy, Portugal and Greece).

## NEW PASSENGER CAR REGISTRATIONS PER GROUP

In 2017, market share of French groups in West European market increased by more than 2 percentage points to 23%, thanks in particular to the integration of Opel in the PSA group since August 1.

French manufacturers rely on the complementary nature of their brand ranges. The Renault group have Renault (7.6% market share) and Dacia (2.6%); the latter accounted for only 0.5% of the market in 2007. The PSA group now has four brands since August 1, 2017: Peugeot (6.2%), Citroën (3.8%), Opel/Vauxhall (2.2 %) and, since 2009, DS (0.3%).

Six major “generalist” European groups, producing a complete range of vehicles, each held around 6% of the market or more. The market trend towards higher-end vehicles did not help them.

Volkswagen's market share is in decline for the third year running.

# 23%

Share of new passenger cars sold in Western Europe manufactured by a French group

### ► MARKET SHARES OF GROUPS (1) IN EUROPE

As a % of the total market

As a % of the total market

(1) The scope of the groups reflects their situation as at 01/01/2018.

(2) Opel included in GM group until July 31, 2017 and PSA group since August 1, 2017.

See page 74 for groups definitions.

As a % of the total market

Since 1999, the Volkswagen group (VW), with its four main brands, has strengthened its positions and exceeded the threshold of 20% of market share, but lost 1.8 percentage points to 23% compared to 2014.

Market share of the French groups Renault and PSA (23% in total) increased, over 2007 levels. They exceeded 25% between 2001 and 2003, a more favourable period where the French and Southern European markets accounted for 45% of the West European markets, compared to 39% in 2017. Dacia's share progressed and DS's share is emerging.

The market share of the General Motors (GM) group, now without the Chevrolet brand which is no longer distributed in Europe and without

Opel brand since August 1, 2017, was 3.9%, i.e. a decline of 2.7 percentage points. In 2017, Ford's market share was 6.7%. In the middle of the 1990s, the two American groups each enjoyed a market share of around 12%.

The Fiat group now includes Chrysler group brands. Its market share was up at 7% compared to almost 13% in 1997 and 15% in 1989. In 2017, Fiat's market share was 5%.

The German Daimler and BMW groups, specialists in higher ranges and sales to companies, are pursuing a strategy of expanding their range and have remained at very high levels in 2017. Thus Daimler (Mercedes and Smart) consolidated the growth begun in 1997 with the effect of the diversification of its vehicle range, to 6.8%. BMW,

including the Mini brand, fell slightly (7.0%).

Toyota group's share, in continuous growth from 1995 (3%) to 2007 (6%), then fell back one third over a period of four years, before stabilising at around 4.2%.

The market share of Hyundai-Kia, from being almost non-existent in 1990, and 2.1% in 2000, enjoyed strong progression during the crisis (+3 percentage points). Its share was 6% in 2017, a record level.

## RANGE RANKING IN 2017

# 64 & 93

Models and body styles offered  
by French groups

The French groups expanded their vehicle ranges by proposing 50 or so models (excluding Opel integration) compared to 27 in 2000. Over recent years, they have developed their ranges on different product segments (multipurpose vehicles, 4WD, SUV, sedan). They regularly renew existing models (308, 5008, Koleos, Megane Scenic, Captur) or develop new ones (C3 Aircross). In addition, each body includes different versions depending on the equipment of the car which involves the marketing of several thousand possible combinations (more than 8,000 according to ADEME).

### BREAKDOWN OF NEW PASSENGER CAR REGISTRATIONS BY RANGE IN EU-18

As a % of the total market

Source: CCFA

In 2017, there was great product diversity; market share of the 15 best-selling vehicles in Europe was 27% compared to 30% in 2015 and 40% in 2000. At the lower end, French manufacturers, who previously had eight models, now have over forty.

The share of higher-end models was 32% in 2017 in Western Europe, i.e. an increase of 4 percentage points compared to 2014. Growth overall was identical in France, but this ratio was 20%.

The share of sedans, still dominant, has declined since the recovery of the European market in 2014, in favour of the category «Other» which continues to benefit from the development of 4WD and SUV in the lower range (Peugeot 2008, Renault Captur, etc.). The latter has thus increased by 10 percentage points in three years and now represents 32% of the market.

Each European country model profile was stable

until 2008, with Southern Europe preferring lower and lower-middle ranges, whilst Northern Europe continued to prefer higher-end vehicles and station wagons. But, in 2009, the success of lower-end ranges and sedans, particularly in Germany and in the UK, made this contrast between the two regions less stark. This trend continued until 2010 with the exception of Germany, where higher-end vehicles returned to slightly higher market shares (38%) than the long-term position (35%) for the third year running. Spain and Italy has also seen an increase in the market share of economy and lower-end vehicles of around 10 percentage points since 2000.

# 9 OUT OF 15

## TECHNICAL CHARACTERISTICS OF NEW PASSENGER CARS

# -5 POINTS

**Drop in the share of new cars fitted with diesel engines as a proportion of total registrations between 2016 and 2017**

Having grown significantly from 1997 to 2007, the share of new cars equipped with diesel engines in Western Europe as a proportion of total registrations is around 50%. In 2017, it fell by more than five percentage points to 44%, 11 points below the 2011 record. In Western Europe, outside France, it was 44%, 8 percentage points down compared to the same reference year. The deterioration amounted to 29 percentage points in Belgium while in Italy, this share increased slightly (+1 point).

On this market of only 6.3 million units, French groups had a market share of 23% in 2017 (28% in 2010), i.e. around 1.4 million new diesel cars. The ratio is almost identical for other energies

(22% compared to 19% in 2016). This fall involved an increase of nearly 90% (excluding Opel integration) of their registrations of petrol-powered cars or other, an additional 731,000 units.

Like France, the four other main Western European countries (Germany, Spain, Italy, UK) saw companies purchasing more diesel cars (around 60% of their registrations) than households (around 40% of their purchases). In 2017, the share of diesel in households had fallen around 30% in France and the United Kingdom.

### ► TECHNICAL CHARACTERISTICS OF NEW PASSENGER CARS IN EUROPE IN 2017

ALL 18 COUNTRIES	1,587	97	14.8	44.4

Source: CCFA

In Europe, average engine sizes and power ratings of cars differ considerably from one country to another. They depend largely on economic, tax and geographical conditions in each national market. Because of the minimisation of engines (downsizing, identical engine power with a lower engine capacity), the average capacity of new private cars in Europe fell 153cm<sup>3</sup> between 2007, the highest point, and 2017. On the other hand, the average power rating has increased by 7kW since 2013, to 97kW. These indicators tend to be higher in Northern Europe.

The share of 4WD continuously increased since 2010; it stood at 15% of the European market, i.e. 2.1 million units, compared to 8% in 2009. The level of equipment varies substantially depending on national characteristics. In Switzerland, Norway and Austria this share is higher to meet the demands of mountainous topography. In Germany, it was 20%, i.e. an increase of almost 9 percentage points compared to 2007.

The share of diesel is substantially influenced by regulations and tax arrangements in each country.

In Europe, in a growing market in 2017, the share of diesel cars fell to 44.4%. Nevertheless, volumes decreased 8% because of the high level of demand. In Ireland and Portugal nearly two-thirds of new cars registered are still diesel cars, but this ratio is down by around 4 points compared to 2016. All Western European countries are seeing a sharp decline in this share of diesel: from 1 percentage point in Italy and Denmark to more than 10 points in Greece and Luxembourg, via the United Kingdom (-6 points in a declining market) and Spain (-8 points).

## PASSENGER CARS IN USE IN EUROPE

In Western Europe, an area of high auto density (from 494 in Ireland to 706 in Italy), the vehicles in use increased 1.4% to January 1, 2016. The marked contrast between a dynamic Northern Europe and the South of Europe affected by the financial crisis since 2013 has petered out.

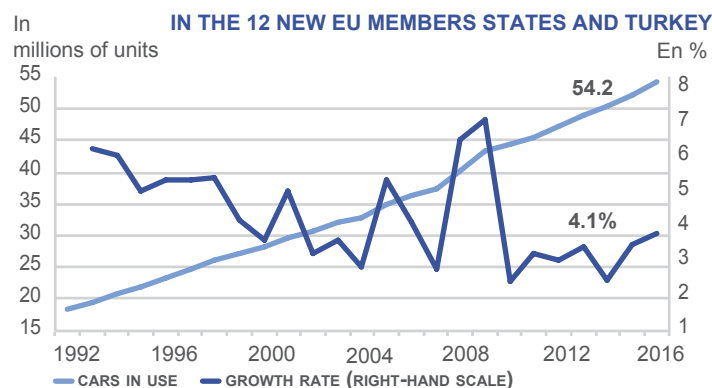

In the new EU member states and Turkey, where car ownership is lower (from 195 for Turkey to 628 for Poland), the economic and financial crisis

substantially slowed the rate of vehicle stock growth: nearly 4% compared to 5-7% between 2005 and 2009. Demand for smaller price-tag cars remained primarily satisfied by imports of second-hand vehicles. In 2016, this zone accounted for 20% of the European vehicles in use compared to 15% in 2005.

Having settled at around one third between 2000 and 2009, the share of cars of more than 10

years of age in Western Europe has constantly increased to reach 43% in 2016. The low number of registrations of new passenger cars, particularly in Southern Europe, is one of the reasons for this high percentage. Western Europe has become a renewal market. Within the new EU member states and Turkey, this share can be estimated at a little over 50%.

### Passenger cars in use on January 1 each year

(1) The change was calculated on a like-for-like basis.

National sources: statistics organisations, French Transport and Interior Ministries, professional sources

On January 1, 2016, the number of passenger cars in use in Western Europe (EU-15, Switzerland and Norway) was 217 million cars. High levels of ownership and the crisis affected growth, and the pace is now more in line with population growth. Whilst the vehicles in use decreased in certain countries of Southern Europe, it did increase in the countries of Western Europe overall in 2015. In 2016, Italy (+0.7%), Spain (+1.5%) and Portugal (+2.2%) returned to substantial growth rates close to those recorded for the UK (+2.2%) and Germany (+1.5%). In France (+0.6%), growth was lower than in the main West European countries.

Having increased 2 percentage points per year between 2002 and 2009, the share of diesel cars in Western Europe increased by more than 1 percentage point per year since, and stood at 42% on January 1, 2016. In five countries, this engine type remains the majority: Austria, Belgium, Spain, France and Luxembourg. However, although in progress, the share is lower in Germany (32%) and almost equivalent to the overall average in the UK (40%) and in Italy (42%).

In the new EU member states and Turkey, growth in the vehicles in use was contrasted. The vehicles in use of Slovenia and Hungary increased by 1.9% and 6.1% respectively between 2010 and 2016. Over the same period, vehicles in use in Romania (+21%), Poland (+26%) and Slovakia (+28%) increased at a high rate. The Czech Republic recorded a moderate growth (+14%), but this figure applies to what is already a large number of vehicles in use. The growth of Turkey's vehicles in use remained extremely high (+49%). Within these new EU member states and Turkey, the share of diesel engines is 33%, up around one and a half percentage points annually over recent years.

## NEW LIGHT COMMERCIAL VEHICLES IN EUROPE

The West European market for light commercial vehicles, which was highly impacted by the 2009 crisis, stabilised at around 1.5 million units before growing, since 2014, to 1.9 million units in 2017 (+42% since 2013). However, the decline is still 137,000 units compared to the record level of 2007.

Between 2007 and 2017, the UK and German markets were slightly up (+47,000 and +22,000 respectively). In the other three major markets, volumes fell from -23,000 in France to -77,000 for Spain, with in between, -43,000 for Italy. Increases since 2013 are spectacular in Southern Europe, but pre-crisis levels have not yet been reached, unlike in Northern Europe. Southern

Europe, including France, accounted for 45% of the European market, compared to 52% in 2007.

In 2017, French groups saw sales up 21% to 785,000 units, thanks in particular to the integration of the Opel brand into the PSA Group since August 1, 2017; they reached 41% of the market. Despite their strong presence in Southern Europe, French companies have nevertheless been able to increase their market share to a record level, seven percentage points higher than that observed in 2007.

**MARKET SHARE OF FRENCH MANUFACTURERS IN MAJOR EUROPEAN COUNTRIES**

As a %

Source: CCFA

Since tax rules are not the same in all European countries, the number of light commercial vehicles as a percentage of all light vehicles goes from 7% in Germany to 19% in Norway. Overall, the 2017 average was 12%.

For many years, the renewal of products and the adapted answer they bring to today's economy in terms of transportation, services and mobility have improved sales of these vehicles. The 2009 crisis had a substantial impact on the market, which had returned to its 1996 levels.

In the van segment, French groups' market shares were protected by the success of Renault Master, Peugeot Boxer and Citroën Jumper. In the small van segment, competition is cut-throat, but French

groups can rely on a wide range (Citroën Berlingo and Nemo, Peugeot Partner and Bipper and Renault Kangoo). In 2017, four of the ten highest-selling models were French (Citroën Berlingo, Peugeot Partner, Renault Kangoo, Renault Trafic).

In Spain and Belgium, French groups' market share easily exceeded 40% in 2017. In Germany and in Italy, who have their own domestic manufacturers, their market share was 23% and 31% respectively, higher than in 2005. In numerous countries such as Portugal, Denmark and Ireland, gains in market share since 2010 have exceeded eight percentage points.

Total sales of new light commercial vehicles have risen sharply in the past three years: between 2016

and 2017, they grew by +8% in Germany, +11% in Spain and Belgium, and +13% in Denmark.

France remained the largest European market (439,000 units) ahead of the United Kingdom (370,000 units), Germany (275,000 units), Spain (200,000 units) and Italy (195,000 units).

## HEAVY TRUCK MARKET AND PRODUCTION IN EUROPE

The European market for commercial vehicles over 5 tonnes slightly progressed in 2017 (+1%) at nearly 300,000 units, compared to less than 210,000 in 2009. Contrary to the 1993 crisis, where the market recovered its high sales levels five years later, the 2009 crisis is different and seems to be settling at a new equilibrium, lower level.

Western European production fell by 3% to 475,000 units. After having suffered the serious crisis of 2009, production is now more than twice the trough of that year, emphasising the scale of fluctuations linked to economic conditions in this sector and the importance of extra-European demand

### NEW HEAVY TRUCK REGISTRATIONS IN EUROPE

### RENAULT TRUCKS' MARKET SHARE IN EUROPE

Source: CCFA

In Europe, the heavy truck market reached a record level in 2008; the return to investment and the recovery of world trade since the second half of 2003 had boosted that recovery, before the 2009 financial and economic crisis really took its toll.

Heavy truck investment cycles are very long: the high points of 2000, 2006-2008 represent 75% more than the lowest point in 1993, i.e. nearly 150,000 additional vehicles. Compared to the two dark years for commercial vehicles (1993 and 2009), the market is finding it more difficult to recover after the most recent crisis than in 1990s. In 2017, eight years on, the market is 44% up

compared to 68% up in 2001.

The favourable trend for heavy commercial vehicles is slow and regular. Since 2003, the share of vehicles of 16 tonnes and more (rigids or tractors) represents more than 8 out of 10 vehicles.

The share of alternative energies for heavy trucks (NGV, electric, other) is very low (around 1% of the market).

Renault Trucks' international development was affected by the collapse of Southern European markets (Spain and Italy). The weight of this zone

in Western Europe, outside France, fell from 27% to 14% between 2007 and 2014 before bouncing back to 21% in 2017. Renault Trucks' European market share outside France (4%) has also fallen compared to that observed in 2008 (6%). Overall, its registrations increased in 2017 (+8%) and its market share in Europe was at 8%. Outside Europe, Renault Trucks has substantial volumes in Africa (Maghreb) and the Middle East.

## FRENCH MANUFACTURERS IN THE NEW EU MEMBER STATES

# 23%

**New light vehicle market share of French groups in the major new EU countries**

In 2017, vehicle production increased (+2% to 4 million vehicles), settling at a record level. The sales of new vehicles increased 11% to 1.5 million units. The difference between production and sales of new vehicles was therefore 2.5 million vehicles. The local market for new vehicles is way below 2007 level.

French groups are commercially present in this zone for many years, and also have industrial sites: PSA in Slovakia, Czech Republic (with Toyota in Czech Republic) and in Poland (with Opel integration since August 1, 2017); Renault in Slovenia and in Romania. All these sites made

around 1,000,000 units in 2017. Registrations of new vehicles still represent small volumes for French groups with 200,000 units. These volumes should increase given the very low automotive densities observed when compared to Western Europe.

### ► THE VEHICLE MARKET AND PRODUCTION IN THE MAIN COUNTRIES OF CENTRAL AND EASTERN EUROPE: NEW EUROPEAN UNION MEMBER STATES (1) (IN THOUSAND OF UNITS)

	2016	2017	Change
<b>VEHICLE PRODUCTION</b>

Light commercial vehicles	151	156	3.4%
Heavy trucks	69.6	67.5	-3.0%

(1) Excluding Malta and Cyprus.  
Sources: CCFA, OICA

Whilst the EU-15 automotive market is now dominated by replacement demand, the same does not apply to new member states and neighbouring countries, where the potential for access to vehicle ownership is much higher.

In 2017, Central and Eastern European Countries (CEEC) activity progressed just like that of Western Europe after the recovery of the European market.

In 2017, new vehicle sales progressed sharply for the fourth consecutive year. Sales have

substantially increased over all countries (with the exception of Latvia and Czech Republic), and more particularly in Hungary (+15%) and Poland (+17%).

The average cylinder capacity and power of passenger cars registered in this zone (1,580cm<sup>3</sup> and 96kW respectively) are almost identical to those in Western Europe. The share of 4WD stands at 12%, two points lower than in Western Europe. In contrast, the weight of diesel (28%) is much lower (-16 percentage points). The ratio of

the lower ranges is 65% and that of the higher ranges is 34% (compared to 68% and 32% respectively).

The share of electric and hybrid passenger cars was 0.2% and 2.5% respectively in 2017 (compared to 0.9% and 4.1% in Western Europe).

■ 2008 ■ 2015 ■ 2017

## THE AUTOMOTIVE INDUSTRY IN THE EUROPEAN UNION

In 2015, the European automotive industry employed 2.4 million people, 45% of whom in vehicle manufacture. In Western Europe, a rebound has taken place since 2013 (+49,000 people) thanks to Germany (+36,000 people), Spain, the United Kingdom (+11,000 people each) and Sweden (+4,000 people). The British workforce has even increased by 19% since 2011. Nevertheless, since 2005, the number of employed people decreased in Western Europe (approximately -160 000 people) and increased in Eastern Europe (around +330,000 people).

The automotive sector also generates indirect jobs (around one third of the number of direct jobs, according to ACEA).

The added value per person in work has increased in France since 2012 but remains lower than the European average and the level of expenditure on headcount per person in work is still higher than the European Union average.

The share of employers' social contributions as a proportion of staff cost was 29% in France compared to 18% in Germany, with the European average at 22%.

(1) Since 2008, data has been published in a classification of new economic activity involving in particular a change to the scope of the automotive industry (inclusion of manufacture of electrical and electronic equipment).

(2) 6 main new EU member states: Hungary, Poland, Czech Republic, Romania, Slovakia and Slovenia: body and trailer manufacturing employees are included in the figures for vehicle manufacturers.

Sources: Eurostat and CCFA estimates

The automotive industry, one of the essential sectors of the European economy, comprises:

- vehicle manufacture;
- body and trailer manufacture;
- automotive equipment manufacture.

The data collated in this table come from national company surveys, harmonised by Eurostat. The difficulties encountered, nationally and Europe-wide, both for the collection and homogenisation of data explain the lack of reliable figures post-2015.

Germany accounted for 35% of all employees in the automotive industry. France had 9%, compared

to an average of around 6% for Spain, Italy and the UK. The six new EU member states' share (Hungary, Poland, Czech Republic, Romania, Slovakia and Slovenia) was 28%.

The automotive industry continued vary greatly from one country to another in terms of structure and salary costs.

In Germany and Sweden, more than 60% of the workforce in the automotive industry was employed in vehicle production, 53% in France and 54% in the United Kingdom, while this share was around 22% in the six new EU member states. It was 41% and

47% respectively in Italy and Spain.

According to ACEA, the ratio of auto industry jobs as a portion of the working population averaged 1% in the European Union in 2016 with disparities between the member countries. The range was 2-3.2% in Germany, Slovakia and Czech Republic, compared to 0.6% in the UK. In France and Italy the percentage was around 0.7%. Poland's was slightly higher than the European average, at 1.1%.

## FRENCH AUTOMOTIVE GROUPS IN 2017

### PSA group: [www.psa.fr](http://www.psa.fr)

In 2017, in a context of growing markets, particularly in Europe, and the integration of Opel on August 1, 2017, PSA Group sales increased by 15%. Growth is very dynamic in Europe (+ 23%), where the group still ranks second (passenger cars + light commercial vehicles). Outside this zone, the manufacturer's sales increased significantly in Latin America, but fell sharply in Southeast Asia.

The international development strategy is based largely on long-term targeted cooperation ventures with other manufacturers. In China, the group is cooperating with Dongfeng Motor, with which it has developed a strategic partnership, and with China Changan Automobile Group. Furthermore, the group has several projects for setting up production or assembly plants in markets with development potential (India, Iran, Morocco, Algeria, Malaysia, Uzbekistan, etc.).

PSA Group has a headcount of around 170,000 people (excluding Opel/Vauxhall) throughout the world, 68,000 of whom are in France on some twenty sites (assembly, engine production and mechanics; R&D centres, head office, etc.). Apart from assembly factories (cf. adjoining page), the group has a number of large sites in France, such as Vélizy (R&D), Douvrin and Trémery (engines), Vesoul (spare parts warehouse) and Valenciennes (gear boxes), employing up to several thousand people.

In the technology field, the group has three priority objectives: clean technologies (improving the efficiency and environmental performance of its vehicles), autonomous, connected cars (promoting the emergence of new transport and mobility models, whilst saving time and energy for customers), and finally, making attractive cars. It is also developing an ecosystem of partners to meet its targets.

In 2017, the group made €2.4 billion of tangible investments and 2.2 billion in research and development.

At the beginning of 2016, in a logical continuation of its "Back in the race" programme the manufacturer introduced a performance and profitable organic growth plan entitled "Push to pass" for the

2016-2021 period. Its objectives revolve around increasing operating margins and turnover. Product development, the internationalisation of the group, the growth of activities particularly in after-sales and used vehicle sales, are also priorities within this plan.

### Renault group: [www.renault.com](http://www.renault.com)

Renault's global sales strongly increased (+9%) thanks to sturdy European market sales growth and the integration of Lada brand since January 1, 2017. The Renault brand ranks second on the market for light vehicles in Europe. Outside Europe, the group has grown over all geographical zones and more particularly in Africa and Asia.

The venture with Nissan within the Alliance which begun in 1999 has been optimised and enlarged over time (agreement signed with Daimler in 2010, integration of Mitsubishi in 2016). New synergies (industrially, on electric vehicles, support functions, etc.) and new projects are being set up. The strategic partnership with AvtoVAZ, with the objective of accelerating their growth and strengthening their presence in Russia, achieved a new level with the inclusion of the Russian manufacturer in the Renault group.

The group's innovation priorities are the electric vehicle (improving performance and competitiveness), the connected vehicle (developing communications systems linking vehicles, infrastructures and the driver), and the autonomous vehicle (experimenting with technologies and new forms of mobility). It is also developing partnerships (universities, partner companies, etc.).

Renault group employs 180,000 people throughout the world, 48,000 of whom are in France on 15 sites: assembly, manufacturing of engines and mechanics (Cleon, Ruitz); R&D centres (Guyancourt); head office, etc.

In 2017, Groupe Renault made €2.3 billion of tangible investments and, excluding AvtoVAZ, invested €2.6 billion in research and development.

At the end of 2017, the group launched a new strategic plan called "Drive the future – 2017-2011". Its priorities: increase competitiveness, strengthen

global presence, and by 2022, build the mobility of the future (electric, connected, autonomous, shared). Their targets in figures focus particularly on increased turnover and operating margins.

### Renault Trucks: [www.renault-trucks.com](http://www.renault-trucks.com)

Renault Trucks progressed in 2017 in a slightly growing Western European market. Its market share was 8%.

Renault Trucks assembles its trucks in France at its Bourg-en-Bresse (Ain) and Blainville-sur-Orne (Calvados) plants. The truck manufacturer relies on partners for local assembly outside Western Europe, in Morocco and in Iraq. Its subsidiary, Renault Trucks Defense (which became Arquus in 2018), the protected mobility vehicle specialist for defence and safety produces and assembles its vehicles in France (cf. adjoining page).

As a member of Volvo Group which employs almost 100,000 people throughout the world, Renault Trucks has over 9,500 employees, 80% of whom are in France. Apart from the complete assembly of vehicles, Renault Trucks has engine assembly and die-stamping operations in Venissieux, design and research in Saint-Priest, in the suburbs of Lyon, and parts reconditioning in Limoges. In 2013, Renault Trucks entirely renewed its truck range (T, C, K, D and D Wide), designed for sturdiness and lower operating costs, in particular through better energy efficiency.

The truck manufacturer offers a range of alternative energy vehicles (gas, biodiesel) and a range of services (fleet management, repair and maintenance, financing and insurance, etc.) including even greater fuel-saving solutions (Optifuel Solutions), one of the main cost items for hauliers. In 2018, the manufacturer will market a range of 100% electric vehicles and will implement a line dedicated to them in the Blainville plant.

## WORLD PRODUCTION OF FRENCH GROUPS

# 236 MILLION

**Vehicles produced by French automotive groups worldwide since 1898**

In 2017, global production of French groups continues to grow (+17% at 7.8 million vehicles); it thus reached a new record level thanks in particular to the integration of Lada into the Renault group on January 1, 2017 and that of Opel into the PSA Group on August 1, 2017. Since 1996, production has increased by 106%, i.e. an annual average growth of 3.5%, thanks primarily to the increase in opportunities in Europe outside France and subsequently, outside Europe. Groups have developed their production capacities in the latter zone, which in 2017 accounted for around 30% of overall production.

Passenger car production amounted to 6.9 million cars, a new record level after 2010, 2011 and 2016; that of light commercial vehicles amounted to 910,000 vehicles, the highest level, ahead of that of 2016 with 29,000 additional units

(Lada not producing light commercial vehicles). Compared to 2007, production increased by 30% for passenger cars (+1.6 million units), and it also increased by 10% for commercial vehicles (+80,000 units).

The French groups have a great diversity of sites: the historical factories (Sochaux, Flins), the large ones (Vigo, Pitesti), those producing a single type of model (Kolin, Novo Mesto) or a great diversity (Mulhouse, Togliatti), light commercial vehicles or their derivatives (Hordain, Batilly).

### ► PRODUCTION OR ASSEMBLY SITES PER MODEL

PSA group	
Brands and models	Production or assembly sites in 2017
Peugeot: i0n / Citroën: C-ZERO	Mizushima (Japan) (Mitsubishi)
Peugeot: 108 / Citroën: C1	Kolin (Czech Republic) (TPCA)
Citroën: E-Mehari	Rennes (France)
Peugeot: 206, 207	Teheran (Iran) (Iran Khodro)
Peugeot: 208	Poissy (France), Trnava (Slovakia), Porto Real (Brazil)
Citroën: C3 / DS: DS3	Poissy (France), Trnava (Slovakia), Porto Real (Brazil)
Peugeot: 301 / Citroën: C-Elysée, C3-XR	Vigo (Spain), Wuhan (China) (DPCA)
Peugeot: 308	Sochaux (France), Buenos Aires (Argentina), Wuhan (China) (DPCA)
Peugeot: 2008	Mulhouse (France), Porto Real (Brazil), Wuhan (China) (DPCA)
Peugeot: 3008	Sochaux (France), Chengdu (China) (DPCA)
Peugeot: 5008	Sochaux (France), Chengdu (China) (DPCA)
Citroën: C4 / DS: DS4	Mulhouse (France), Vigo (Spain), Buenos Aires (Argentina), Kaluga (Russia) (PCMA), Wuhan, Shenzhen (China) (DPCA, CAPSA)
Citroën: C4 Cactus	Madrid (Spain)
Peugeot: 4008 / Citroën: C4 Air Cross	Okazaki (Japan) (Mitsubishi)
Citroën: C5 / DS: DS5	Rennes-la-Janais (France), Sochaux (France), Wuhan, Shenzhen (China) (DPCA, CAPSA)
DS: DS6	Shenzhen (China) (CAPSA)
DS: DS7 Crossback	Mulhouse (France)
Peugeot: 405	Teheran (Iran) (Iran Khodro)
Peugeot: 408	Buenos Aires (Argentina), Kaluga (Russia) (PCMA)
Peugeot: 508	Rennes-la-Janais (France), Wuhan (China) (DPCA)
Peugeot: Bipper / Citroën: Nemo	Bursa (Turkey) (Tofas)
Peugeot: Partner / Citroën: Berlingo	Vigo (Spain), Mangualde (Portugal), Buenos Aires (Argentina)
Peugeot: Expert / Citroën: Jumpy	Hordain (France)
Peugeot: Traveller / Citroën: Spacetourer	Hordain (France)
Peugeot: Boxer / Citroën: Jumper	Italy (Sevelsud)
Opel: Nouvelle Astra	Ellesmere Port (United Kingdom)
Opel: Vivaro	Luton (United Kingdom)
Opel: Corsa, Adam	Eisenach (Germany)
Opel: Astra, Nouvelle Astra, Cascada	Gliwice (Poland)
Opel: Zafira, Insignia, Nouvelle Insignia	Rüsselsheim (Germany)
Opel: Corsa, Meriva, Mokka, Crossland / Citroën: C3 Aircross	Saragossa (Spain)
Opel: Grandland	Sochaux (France) (PSA)

## MARKETS FOR NEW VEHICLES FROM FRENCH GROUPS

In 2017, French groups' sales outside France grew more strongly (+19%, i.e. +1.1 million units) than their national markets (+7%, i.e. +73,000 units), mainly as a result of integration of Lada into the Renault Group on January 1, 2017 and Opel into the PSA Group on August 1, 2017.

French groups' share of sales in France was 19% overall: 17% for passenger cars, 29% for light commercial vehicles and 41% for heavy vehicles. These ratios are down for light vehicles because of increases in deliveries to the rest of Europe and to South America.

Foreign markets accounted for 81% of French groups' sales, compared to two thirds around the

year 2000 and short of 60% in 1990.

Deliveries outside the European Union were around 53% of total sales in 2017 for French groups i.e. a lower level than 2010 and 2013. The continued partial recovery of the markets of Southern Europe and the decline in some of those in emerging countries left this ratio practically stable in 2016 and 2017. It was under 30% in 2000.

### ► WORLD PRODUCTION OF FRENCH GROUPS

### ► VEHICLES REGISTRATIONS IN FRANCE

### ► FRENCH EXPORTS

French groups developed their activities around the world further to the opening up and development of emerging markets. In 1990, the French market for new passenger cars represented 2.3 million units, compared to 3.3 million units produced worldwide by the PSA and Renault groups. These data amounted respectively to 2.1 and 4.6 million cars in 2000. In 2017, registrations in France amounted

to 2.1 million units, while production of these same manufacturers reached 6.9 million units.

From 2009 to 2015, the impact of the crisis in countries where French groups have a strong presence did impact their deliveries of passenger cars outside France. In 2017, they rose (+20% to 5.7 million units), like those of light commercial

vehicles (+9% to 650,000 units). On the other hand, those of heavy trucks fell slightly (-1%).

## ECONOMIC RATIOS OF THE AUTOMOTIVE INDUSTRY IN FRANCE

# 2.6%

**Average of the share of sales devoted to investment into automotive industry**

At the crossroads of numerous techniques, auto-manufacturing requires major investments: since the 2009 crisis, almost 2.6% of turnover. In the industry perimeter (including extraction industries, agro-foods), the automotive industry accounted for 4% of tangible investments in 2015 (7% in 2009).

Given the growth in societal demands (environment, road safety, new mobilities, etc.) and the development of the digital economy, the automotive industry is investing more in intangibles and R&D (cf. following pages) to

which the automotive competitiveness clusters are particularly well suited.

Value added per employee (in 2015 Euro) amounted to 105,000 euros in 2016, a record level, thanks to the growth of the European market which increases the markets and the internal efforts of the manufacturers.

(1) CCFA estimates for 2016: see also pages 88 and 89 (in particular for concept changes).

Source: SESSI, INSEE since 2008

Each year, INSEE produces annual company surveys, one of the main aids to reading French industry trends. A major revamp of these surveys has been undertaken with the ESANE information system. Also, a new economic activity nomenclature was introduced at the beginning of 2008 (see pages 88 and 89).

The automotive industry includes the production of automobiles, bodywork, caravans and leisure vehicles, but also upstream, the manufacture of automotive equipment. However, the statistics do not cover the whole scope of suppliers to the automotive industry, since certain products like tyres, plastics, equipment supplies and glass feature in other business nomenclature categories

(see also page 67).

### Automotive manufacturing

After 2004, in line with booming vehicle production, the added value (before tax) in automotive industry, at constant value and per employee, fell under the impact of different factors: costs linked to new environmental standards, stagnation and decline of the West European market for new vehicles. Since 2012, it has progressed regularly. In 2016, the increase was 90% up from 4 years earlier. So as to develop new models and optimise production capacities, automobile manufacturing has dedicated almost 2.6% of its turnover to investment, i.e. almost €2 billion. Research and

development costs (see page 34) are not included in these figures. The share of turnover made from exports has increased uninterruptedly since 1990, when it reached 38%, and is now around 64%, compared to around 34% for the manufacturing industry as a whole.

# THE AUTOMOTIVE INDUSTRY IN FRANCE'S REGIONS

# 4.1

**Units of value added in the national economy generated for each unit of added value in the automotive sector**

All told, including direct jobs (manufacturers' production and research sites), indirect jobs (suppliers' sites) and trickle-down jobs (generated by suppliers' workload), the automotive industry often represents an essential pillar of local economies.

## ► AUTOMOBILE CONNECTED JOBS IN THE REGIONS

Regions	Direct jobs	Indirect jobs	Induced jobs	Reference year	Sources

## ► ADDED VALUE MULTIPLIERS BY SECTOR (EXCLUDING COKING-REFINING)

Sectors	Agriculture	Agri-food products	Capital goods	Automotive	Aeronautics and space	Other transport equipment (excl. aeronautics)	Other industrial products	Power, water, waste	Construction	Trade, services
<b>Multipliers</b>	2.3	2.8	2.3	4.1	4.8	3.0	2.3	2.1	2.0	1.5

Source: INSEE - Outlook report - March 2012

INSEE's March 2012 economic report shows that one unit of added value in the automotive sector generates 4.1 units of added value in the national economy. The automotive industry boasts the biggest added value multiplier after the aeronautics and space industry. Also, an industrial site creates local business beyond its direct employees. INSEE's regional divisions have produced surveys which describe some of the indirect jobs generated by suppliers, sub-contractors and service providers, plus trickle-down jobs, i.e. those needed to satisfy employees' (direct and indirect) and their families' consumption.

Various regional INSEE publications show the importance of the automotive industry in terms of direct, indirect and induced jobs. A study of INSEE Bourgogne-Franche-Comté shows the presence, in 2015, of 45,000 employees excluding temporary work in the automotive sector, 14,570 of whom in the automotive industry and 14,820 in the manufacture of automotive equipment. The core workforce of the automotive industry (manufacturers, equipment manufacturers) is in a wide range depending on the region: from 1,400 employees in Provence-Alpes-Côte d'Azur to 46,700 in Île-de-France. The number of these jobs has decreased by 24% on average in metropolitan France since 2008 (from -11% in Occitania to -40% in Brittany).

According to DARES, the automotive industry employed, in 2015, 24,200 temporary workers (in full-time equivalent), including 3,800 in Île-de-France, 3,100 in Nord-Pas-de-Calais and 2,300 in Franche-Comté.

The research and development sites of the automotive industry as a whole are located in

Île-de-France (eg: PSA in Vélizy and Renault in Guyancourt), but also in other regions. For Nord-Pas-de-Calais-Picardie statistics agency (INSEE) estimated that 12% (13% on average in France) of domestic research and development expenditure (DIRDE) for the region was accounted for by the automotive industry in 2013 ("Des dépenses de recherche en progression", May 2016). In its regional profile, the Bourgogne-Franche-Comté statistics agency (according to April 2016 survey) observed that the automotive industry accounted for 70% of research and development expenditure in midcap companies and large enterprises present locally.

The automotive industry's regional associations (ARIA), a regional relay point for PFA, French Automotive & Mobilities Cluster, includes companies (manufacturers, equipment manufacturers and other suppliers) from the automotive sector in the regions, with the public authorities and training and research establishments. The 11 members end 2017 have a wide range of remits: increasing competitiveness, improving industrial performance, access to new opportunities (customers and markets), emergence of new projects, promotion of the sector's image in the region. They also cooperate with automotive competitiveness clusters. Also, each ARIA runs the regional automotive operational committee (Comité opérationnel régional automobile) which brings together the public authorities (DIRECCTE and the automobile reference agent, the credit mediator, etc.), the UIMM and other professional organisations, and competitiveness clusters.

## ► NUMBER OF EMPLOYEES IN THE CORE OF THE SECTOR (IN THOUSANDS)

	2008	2015
<b>Île-de-France</b>	60,600	46,700
<b>Auvergne-Rhône-Alpes</b>	54,300	44,000

<b>Provence-Alpes-Côte d'Azur</b>	1,600	1,400
<b>Metropolitan France</b>	<b>346,700</b>	<b>263,700</b>

Source: Insee Bourgogne-Franche-Comté, Analyses nb 33

## COMPETITIVE FACTORS IN THE FRENCH AUTOMOTIVE INDUSTRY

In a highly competitive global market, French groups must be competitive whilst addressing factors affecting the whole industry. The latter includes the scale of compulsory charges on the factors of production, exchange rates, and other, more automotive-sector-specific elements like the opening up of the base market to competition, etc. All these factors affect profit margins (difference between gross operating profit and added value). This ratio has an impact on companies' capacity to invest in production (modernisation of sites), in developing products to challenge the competition, in research and development particularly to meet environmental standards, digital for the autonomous and connected car, new mobilities etc. In order to cope with these current revolutions, investments remain important (see pages 24, 88 and 89).

In France, after the crisis, the government introduced a policy to promote competitiveness; manufacturers have also used all the internal

levers they had to develop their activities and keep industrial and research sites in France. All of these actions have borne fruit, but the French industrial apparatus continues to show degraded economic competitiveness.

The INSEE defines taxes on production as all taxes that companies pay on account of their production activities, irrespective of the quantity or value of its assets and services produced or sold. In 2016, they stood at 3.2% of GDP in France compared to 1.5% in Italy and 0.5% in Germany (source: Conseil National de l'Industrie – CNI). The CNI also estimates that over 20% of tax revenues from three of the five biggest taxes on production (corporate property tax (CFE), the company value-added contribution (CVAE), the company social solidarity contribution (C3S) come from the industry which, in 2017, accounted for 14% of added value of the economy as a whole (source: INSEE). The industry is highly exposed to international competition and, according to CNI, its

investment capacity is what allows it to strengthen its competitiveness, excluding price competition.

Competitiveness reflects the industry's ability to cope with competition and develop its sales. It is a relative notion, in this sense that reflects their position in respect of other actors on their markets.

Generalist European manufacturers started to recover from 2014 onwards, further to the bounce-back of 4 million additional units registered since 2013 lowest point. So, to continue its development, the French automotive industry has to ensure comparable performance to that of its European, American, Japanese, Korean and, in future, Chinese and even Indian competitors. Operating margin (operational profit/turnover) is one of the tools used to measure automotive groups performance. Between 2009 and 2013, it was 1% on average for French groups compared to a range of 5 to 8% for German groups. By 2017, that average had reached 7% for French groups, and was at a high level, and close to German manufacturers at the top end thanks to so-called "premium" brand margins. This levelling is necessary to be able to invest substantially to face the many challenges ahead. Beyond problems of global competitiveness of the economy or of industry (salary, social and fiscal costs), some competitiveness factors are specific to the French automotive industry, derived both from the characteristics of the car as a good and those of the global automotive industry.

Of the competitiveness factors affecting French

industry, social charges weighs heavily on the employment factor. France has one of the highest in the European Union, including the euro zone. It is higher than in the UK, Italy and Spain, ... and much higher than in the countries of Eastern Europe. Nevertheless, compulsory charges on production impact automotive manufacturing directly and indirectly right through the supply chain.

In 2012, as part of a competitiveness drive, the government introduced the competitiveness and employment tax credit (CICE), calculated according to the total wage bill, but excluding salaries more than 2.5 times the minimum wage (SMIC). The tax reduction rate has increased from 4% of the gross wage bill in 2013 to 7% in 2017. According to the CICE monitoring committee's 2016 report, CICE eligibility in 2016 stood at 47% for the transport equipment sector (including the automotive industry) compared to 63% for the economy as a whole. The highest rates, above 78%, were enjoyed by non-industrial sectors.

Furthermore, exchange rate fluctuations can have a non-negligible impact on terms of trade because of the substantial and growing share of production outside the euro zone.

From 2002 to 2014, the recovery of the euro has affected the competitiveness of French exports and companies have had to multiply their efforts,

commercially and industrially, to continue to develop opportunities outside the euro zone. The latter, however, accounted for two-thirds of total external outlets in 2017, up from 47% in 2002. In 2017, the euro is on average at a lower level than between 2009 and 2014 compared to the dollar and the won.

On the other hand, there are factors linked to the opening up of the market whether domestically and abroad. In general, the domestic market, known as the "basement market", is a solid pillar for sustaining growth in external markets through international development and innovation. For the French automotive industry, the French market and especially the European market can be considered like their base market; it is open to competition and non-European manufacturers enjoy a significant and constantly growing share. In other car-manufacturing countries such as Japan, access to the market is more difficult and local manufacturers therefore have a broader base market upon which they can build their international development.

## COMPETITIVE FACTORS IN THE FRENCH AUTOMOTIVE INDUSTRY

### SHARE OF FOREIGN BRANDS IN PASSENGER CAR MARKETS

(1) USA: market share based on light vehicles. The Big Three are General Motors, Ford and Chrysler (excluding European brands).  
Source: CCFA

### SHARE OF EXPORTS BY FRENCH MANUFACTURERS OUTSIDE THE EURO ZONE

Source: CCFA

### EURO EXCHANGE RATE VARIATION: FOR 1 EURO

Source: BCE

### RAW MATERIAL PRICES IN EURO

# 2/3

Share of non-Euro zone  
in French groups' external sales  
(all vehicles)

Raw material prices expressed in euros grew strongly between 2001 and 2012. Passing on those prices in final sales prices was difficult in a context of cut-throat competition and households having to arbitrate on spending. In 2014-2015, the rate kept low, before increasing substantially in 2016 and early 2017, although not reaching the high levels observed post-crisis. They fell again in 2017. In addition, the price of raw materials at the time of purchase by the user company may be particularly affected by the commercial policy of the geographical area concerned.

## CONSOLIDATION OF THE AUTOMOTIVE INDUSTRY

# 2018

**Signing of the 2018-2022  
sector contract**

With wide fluctuations on the European automotive market, the automotive industrial production index in France measured by INSEE (base 100 in 2015) has gone through several distinct phases. The first started at the beginning of the crisis, when the index fell sharply from more than 140 early 2008 to 70 at the end of that same year. Then, it fluctuated around 100. Then, in a context where the index increased by 24% between 2013 and early 2018 and in an environment comprising three revolutions: technological, digital and societal, the PFA, Automotive and Mobilities Cluster started a new stage at the end of 2017.

To address a crisis on such a collapse, the automotive sector had to structure itself. Thus,

the Plateforme de la Filière Automobile (PFA) was introduced in 2009 by French groups and their suppliers within the automotive suppliers' liaison committee (CLIFA) to improve the efficiency of their sector. It is now called PFA, Filière Automobile et Mobilités - French Automotive & Mobilities Cluster.

As part of the industry's national council (CNI), the automotive sector strategic committee (CSF) was set up. The automotive CSF includes all members of the segment, upstream and downstream, including trade unions. A new sector contract was signed in the spring of 2018.

### INDUSTRIAL PRODUCTION INDEX - ALL INDUSTRY AND AUTOMOTIVE INDUSTRY

Source: CVS-CJO data by INSEE

The financial and economic crisis had major repercussions for the automotive sector, upstream with suppliers and downstream through to vehicle sales/maintenance, via transport of goods, equipment manufacturing and service to companies, including research and development. Because of reduced business levels, degraded competitiveness and cut-throat competition, the fabric weakened and the PFA had to fix new priorities to address the situation: lean manufacturing, skills and professions of the future, better management of communication, and medium- and long-term competitiveness strategies for automakers and their suppliers.

Since 2010, this has relied at a regional level on the regional automotive industry associations (ARIA). After an initial phase of activity, it consolidated in 2012, in particular around the automotive technical committee (CTA) and its two councils, the automotive technical standardisation council (CSTA) and the automotive research council (CRA). Five programmes were defined: 2L100 (the car consuming 2L per 100 km), the Autonomous Vehicle, VALdriv PLM (structuring and federating the digital transformation of the segment), FORCE (lightening and reducing the carbon footprint by accompanying development of low-cost carbon fibre) and Plant of the Future. The first two programmes were integrated into

the "ecological mobility" solution of the second phase of the "New Industrial France" project launched in 2015. The first stage began in 2013 with industrial recovery plans. The PFA works in partnership with competitiveness clusters and is a stakeholder in automotive CSF. At the end of 2017, the PFA entered a new stage. Its missions focus on fostering innovation dynamics, promoting competitiveness throughout the industry, anticipating jobs and skills, and expressing common positions in the sector, the coordination of the organisation of trade fairs and the sector's communication.

The automotive CSF was created in 2010 within the existing CNI, further to the industry conference signed up the same year, which now includes 15 other committees. It includes passenger car and heavy truck manufacturers present in France, Tier 1 equipment manufacturers and a large number of SMEs and mid-tier firms which supply the automotive industry and come from different sectors (mechanical, plastics, die-stamping, foundry, etc.). The heavy trucks industry, including body builders, is included through the steering committee of the transport industrial sector (COFIT). The downstream activities of the sector (distribution and repairs) are also present, as are R&D companies, in particular competitiveness clusters and the major public

research organisations (IFPEN, IFSTTAR). The trade unions of the industrial branch are also represented. In October 2012, a sector contract was signed defining four major working themes: a shared vision for the segment to anticipate economic changes, innovation and R&D, solidarity of the sector and internationalisation of actors. In May 2018, a new sector contract was signed for the period 2018-2022. It includes four structuring projects: be a player in the energy and ecological transition, create the autonomous vehicle ecosystem and experimenting on a large scale to offer new mobility services, anticipate changing skills and employment needs, and strengthen the automotive industry competitiveness.

## INTERVENTION FUNDS, RESEARCH TAX CREDITS, FUTURE INVESTMENTS

The automotive industry requires major physical investment (production site, etc.) that are written down over very long periods. Furthermore, during design and before sale, vehicles require several years' work in research centres, onboarding continuous improvements, so as to be able in particular to meet societal demands, whether they are linked to safety or the environment, within the energy transition. Manufacturers must also meet new digital challenges (autonomous and connected car). The automotive industry is a capitalistic industry that relies on substantial financing.

During the financial crisis, this particularity was debilitating for the automotive industry

and the public authorities introduced structural instruments to finance them over the long term. Created in 2009 under the banner "fund for the modernisation of automotive equipment suppliers", which became the "automotive future fund" (FAA) in 2015, its mission is to contribute to the development and consolidation of equipment manufacturers that are strategic to the automotive sector, so as to foster larger, more profitable equipment manufacturers able to sign up to long-term partnerships with the manufacturers. The organisation continues to be based on two levels of funding: Tier 1 and Tier 2 (see table below).

### ► INVESTMENT FUNDS

FSI and FMEA	Objectives and attributions
<b>The strategic investment fund (FSI) (created in November 2008) became 'Bpifrance Participations' in 2013 when Bpifrance was created.</b>	Originally a sovereign fund initiated by the public authorities to meet the funding requirements of companies with potential for growth and competitiveness to help the economy. Capital exceeded €15 billion at the end of 2014
<b>Fund for the modernisation of automotive equipment manufacturers (FMEA) (created in January 2009 and which in January 2015 became the 'automotive future fund').</b>	Taking minority shareholdings in companies from the automotive sector with value-creating industrial projects and bringing competitiveness to the economy. The scale of investment is €5-€60 m. Initial allocation of €600 m equally shared between PSA, Renault and FSI (now Bpifrance Participations).

Automotive future fund (FAA) (since January 2015)	Objectives and attributions
<b>Automotive future fund (FAA) Tier 1</b>	€600 m distributed equally between three subscribers (Bpifrance, Renault, PSA) to accompany Tier 1 supplier projects, investing amounts between €5 m and €60 m. 2018: 4-year extension with an investment capacity of €135 m.
<b>Automotive future fund (FAA) Tier 2</b>	€50 m comprising five reference automotive equipment manufacturers (Bosch, Faurecia, Valeo, Hutchinson and Plastic Omnium) and FAA Tier 1, specifically dedicated to Tier 2 automotive suppliers, investing amounts between €1 m and €5 m.

Source: Bpifrance

As part of the long-term financing, the strategic investment fund (FSI), which subsequently became Bpifrance Participations with the creation of the public investment bank Bpifrance, had invested in three automotive companies. The fund for the modernisation of automotive equipment manufacturers Tier 1 (FMEA Tier 1), into which French manufacturers had injected €400 m in addition to the €200 million by the FSI, invested with the fund for the modernisation of automotive equipment manufacturers Tier 2 (FMEA Tier 2) in several companies supplying the automotive industry.

Investments for the future were launched at the end of 2009, further to the Juppé-Rocard report recommending the relaunch of innovation in France. The remit of this €47 billion investment programme (€35 billion in 2010, plus an additional €12 billion in 2013) is to bolster French companies' productivity and competitiveness. A budget of €1.1 billion is dedicated to the vehicle of the future aimed at becoming more economical and more environmentally efficient; €750 m had already been committed by the end of 2016.

The automotive industry also has access to other 'investment for the future' programmes, including a worldwide project to create an 'institute of excellence in decarbonated energies' called

'the communicating decarbonated vehicle and its mobility' (VEDECOM). VEDECOM is based on three Paris area sites and will become the reference of the new eco-mobility sector. It supports three research themes: the electrified vehicle, delegated driving and connectivity, mobility and shared energy. It includes nearly 50 members and partners: major industrial groups, including PSA and Renault, SMEs, research centres and laboratories, schools and training centres and local authorities. The 10-year budget is around €300 million, one third of which is financed by the manufacturers themselves. VEDECOM is also working with PFA on the autonomous vehicle. The Institute grew in 2016 when the City on the Move Institute (IVM) joined. Their field is research and action in urban mobility.

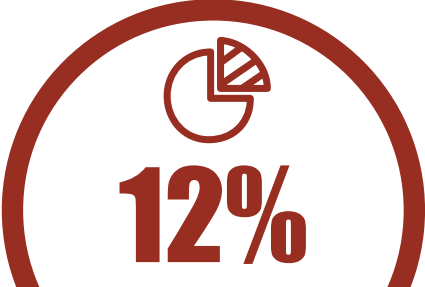

French manufacturers are also stakeholders in the Jules Verne Technological Research Institute (IRT), on a single site in Nantes. It focuses on the transport equipment sectors, including automotive, and energies. The budget commitment is €110 million divided between 73 projects. Its work in connection with the automotive sector concerns the development of processes for manufacturing multi-material parts (composites-metallic).

The public authorities are also supporting R&D development of companies via the 'research

tax credit' (CIR), a tax measure created in 1983, improved in 2004, but more importantly simplified and amplified by the 2008 Finance law. Manufacturing industry in 2014 benefited from 59% of all CIR relief, i.e. €3.4 billion. The automotive industry was the third biggest beneficiary of CIR with 6%, i.e. €323 million.

European Investment Bank loans (EIB) and the European Union's Framework Programme for Research and Development ("horizon 2020" plan for the current one) also provide an effective stimulant to R&D financing. Furthermore, the major traditional automotive countries and BRIC countries also strongly support the automotive sector, in particular in the R&D field.

## RESEARCH AND DEVELOPMENT EXPENDITURE IN THE AUTOMOTIVE SECTOR

**12%**

**Share of the automotive industry in the total research and development budget of companies in 2015**

In 2015, the automotive industry was the second branch in terms of budget for Research and Development (R&D) within companies in France. Their expenditure totalled €5.2 billion, i.e. 12% of all companies' R&D expenditure.

The crisis substantially reduced financial resources but domestic R&D spending fell only by 2% in 2009 and 2010, emphasising the vital importance of the long-term view. Since, they oscillate around €4 billion. It represents 40% of the gross added value of the branch.

The manufacturers must now invest not only to satisfy their customers and respect regulatory standards, but also to face up to the growth of digital applications.

Cumulative over the past 5 financial years, the sector has invested more than €28 billion. Spending has a pull effect on suppliers, such as those from the plastics, electronics industries, etc. In investment terms, the automotive industry ranks higher than both aeronautics and space, and pharmaceuticals industries. It is also the first filer of patents.

According to ACEA, automotive innovation spending in Europe amounted to €50 billion in 2015.

### TOTAL CORPORATE RESEARCH AND DEVELOPMENT EXPENDITURE IN FRANCE IN 2015 IN THE MAIN RESEARCH SEGMENTS

Source: Ministry of Higher Education and Research (MESR DGESIP-DGRI SIES)

### AUTOMOTIVE INDUSTRY RESEARCH AND DEVELOPMENT SPENDING

The research statistics study office (Ministry of Higher Education and Research) performs surveys on R&D expenditure by companies and the wider public sphere. Since 2008, data has been disseminated under a new nomenclature of economic activity. The total R&D spend can be broken down into domestic expenditure (DRDS), for work carried out in France, whatever the origin of the funds, and foreign expenditure (ERDS), for R&D work entrusted to other companies or public research bodies; some of the latter expenditures can be performed abroad. ERDS are much more

volatile than DRDS. The latter declined slightly in recent years.

In 2015, 18% of DRDS in the automotive sector was triggered by subsidiaries of companies under foreign control (owning over 50% of their capital).

In 2015, 30,000 people equivalent full-time (EFT), of whom 19,000 researchers, were included in the R&D headcount of the automotive sector. These numbers were down 3% compared to 2003 (in spite of an increase in 37% for researchers).

According to the national industrial property institute (INPI), in 2017 the PSA (including Faurecia) and Renault groups occupied top positions as major filers of patents; it is important to emphasise that four major automotive suppliers were also amongst the top 20.

## AUTOMOTIVE COMPETITIVENESS CLUSTERS IN FRANCE

Initiated by the State and the territorial authorities in 2005, competitiveness clusters federate companies (major groups and SMEs/intermediate-sized companies), research units and training centres in collaborative project mode. They also offer a number of services: economic intelligence, aid to the filing of patents, networking, etc. Their role is to provide a competitiveness springboard to the French economy by putting the emphasis on its capacities for innovation and encouraging the anchoring and structuring of the different regions of the country.

Companies can belong to several clusters with different specialties in order to obtain know-how (example: software skills for the autonomous vehicle).

The 'national pact for growth, competitiveness and employment' drawn up by the government in November 2012 was intended to focus the action of the competitiveness clusters on products and services that could be industrialised, for greater economic impact in terms of growth of companies and job creation. This new phase was implemented with performance contracts for the period 2013-2018. Automotive clusters have developed their work programmes accordingly, focusing on innovation, skills, networking and launching new solutions.

The automotive competitiveness clusters are associate members of the automotive sector body, the PFA, French Automotive & Mobilities Cluster.

Sources: DGE - Annual survey of the clusters, INSEE databases

In 2017, the automotive industry continued its research and development efforts through those clusters. Through them, the automotive industry is mobilised to meet the challenges of industrial excellence and durable mobility. Their action is transversal and includes car manufacturers, equipment manufacturers, innovative SMEs/intermediate-sized companies, research laboratories and training organisations, including universities.

**The global Mov'eo cluster ([www.pole-moveo.org](http://www.pole-moveo.org)) covers the Île-de-France and Normandie regions.** Mov'eo is dedicated to mobility of the future. Its research and development themes are: safety of road users, intelligent mobility solutions, innovative vehicles and energy storage, materials and systems, drivetrains and energy management. The cluster is also involved in one of the nine solutions of the second New Industrial France project launched by the government in May 2015, as an extension to that launched in September 2013. Mov'eo is therefore involved in the ecological mobility solution including the autonomous and/or connected vehicle and the launch in 2017 of a project to make the Seine Valley an experimentation site of the latter.

**The 'vehicle of the Future' cluster ([www.vehiculedefutur.com](http://www.vehiculedefutur.com)) mobilises historical automotive areas such as Alsace and Franche-Comté,** interacting with Germany and Switzerland. Its mission revolves around

three themes: innovation, industrial excellence serving companies (piloted by the PerfoEST cluster association, which is the ARIA of Alsace - Franche-Comté - Bourgogne) and accompanying companies' growth. In terms of innovation, Mov'eo is concerned with automotive components, electric vehicles, hydrogen vehicles, recycling and mobility services. In 2017, 28 SMEs in the automotive sector were accompanied by the PerfoEST programme on the factory of the future.

**The ambition of the CARA ([cara.eu](http://cara.eu)), is to support the changes in transport systems in urban areas and to represent and animate the automotive and industrial vehicles sector in the Auvergne-Rhône-Alpes region** At the end of 2017, the competitiveness cluster LUTB Transport & Mobility Systems and the Automotive Cluster of the Auvergne-Rhône-Alpes Region took the name of CARA. The latter coordinates structuring activities for the region: manufacturers, transport operators and research centres. Research projects revolve around five key themes: engines and drivetrains, safety and security, vehicle architecture, intelligent transport systems, modelisation and mobility management.

**The iD4CAR cluster ([www.id4car.org](http://www.id4car.org)), set up in the West of France (Brittany, Pays de la Loire)** focuses on special vehicles and sustainable mobility. The four strategic areas of activity are: materials, intelligence of on-board systems, applications and industrialisation, and information

and communication technologies serving mobility. A new strategic plan was introduced for the 2016-2020 period. The cluster also plays the role of an ARIA in its geographical area since early 2017.

Other clusters, not specifically dedicated to the automotive industry, have applications which are of interest to the sector. These clusters work on materials, rubber, plastic, mechanics or mobility. Elastopole, a national cluster, including the regions of Val de Loire, Auvergne-Rhône-Alpes, Pays de la Loire and Île-de-France, is dedicated to rubber and polymers, and three quarters of its applications concern the automotive sector. It also works in collaboration with the automotive clusters. I-Trans, a global cluster in Hauts-de-France which specialises in sustainable terrestrial transport solutions, with five target sectors, including automotive equipment. In 2015, 13% of the employees of the member establishments of this cluster worked for the automobile industry. In addition, I-Trans's innovation challenges are: reducing energy consumption, limiting environmental impacts, developing performance and reliability, enhancing safety and security, and developing design.

## FRENCH AUTOMOTIVE FOREIGN TRADE

2017 was marked by a more dynamic growth of global trade (+3%) and also of the European economy. In this environment, exports of automotive products from French sites amounted to €49 billion, i.e. more than €10 billion additional since 2013 for the activity of French industrial sites. The automotive industry remains one of the leading export sectors next to aeronautics, agri-foods, accounting for more than 10% of total exports. In 2016, in customs rankings, two companies in the sector were among the top five exporters.

Accelerated growth on the European market, natural outlet for French industrial sites, resulted in a very strong increase in exports (+9%); as for imports,

they rose (+8%), with a still significant share of new light vehicle flows from Germany (€8.7 billion). The balance of the industrial automotive sector thus stood at -€9.7 billion.

The positive balance of the 'parts and engines' item fell again (-31% to €1.6 billion), but exports grew by 4% to €22 billion. The surplus can be explained in particular by the production of non-French sites of French manufacturers, which source from France, for example for drivetrain units (more than €3 billion in exports).

Source: Customs

Exports from the automotive industry totalled more than €50 billion in the mid-2000s, before falling back to €34 billion in 2009 with the crisis. Since, they have fluctuated between €39 billion and 45 billion but are still growing since 2014 and totaled €49 billion in 2017.

Exports of passenger cars valued more than €25 billion in 2004-2005 before a very sharp drop to €13.7 in 2009. Subsequently, they fluctuated between €13 billion and 16 billion further in particular to the weak Southern European markets where French manufacturers are well represented. They grew to €18 billion in 2017 thanks to the

dynamism of the European market. The difficulties of competitiveness and the crisis have impacted the passenger car production in France with low unit value.

After a sharp fall in 2009, light commercial vehicle exports have grown continually thanks to the production of new vans in France and the development of that for partners by French groups. They now stand at €4.7 billion, a new record level. Industrial vehicles saw two more years of decline in 2012 and 2013. They stood at €3.3 billion in 2017. Imports of light commercial vehicles and heavy trucks increased, but at a slower pace

than in 2016. The balance of the first, which was structurally deficit, has nevertheless become surplus since 2015.

Exports of parts and engines increased by 4% whilst imports increased by 8%. The balance therefore worsened for the fourth consecutive year (€1.6 billion).

## FRENCH AUTOMOTIVE FOREIGN TRADE

The main customers of the French automotive industry are generally in Europe but do include emerging from Eastern Europe and North Africa.

The top five destination for new passenger cars from France are mainly European, including the other four main markets of the European Union. In 2017, Belgium (€3.1 billion) is slightly ahead of Germany. The United Kingdom ranks fifth with €1.1 billion. Algeria ranks tenth with €370 million.

Germany was the biggest importer of light commercial vehicles with €1.1 billion, ahead of Belgium (€800 million) and the United Kingdom (€559 million). From 2010 to 2017, the value of exports to the top five importing countries more than tripled to €3.1 billion. In 2017, the total value of light commercial vehicle exports reached a

record level of €4.7 billion.

An increase in commercial vehicle over 5 tonnes exports of almost 50% has taken place since 2013, despite a downturn in the European market in 2017. Exports to Germany have increased by 40% and exports to Spain and the United Kingdom doubled.

Exports of parts and engines increased compared to 2010. The top five destinations were in Europe. Germany ranked first (€4.7 billion). Exports to the United Kingdom are almost stable compared to the previous year, but decreased by 9% since 2015. China (€492 million) and Brazil (€379 million) rank respectively eleventh and fifteenth. The latter country has seen a rebound in its market after four years of falling.

Imports of new passenger cars from Germany (€7.9 billion), UK (€2.0 billion) and Japan (€1.3 billion) are high. For heavy trucks, imports from Germany totalled €1.4 billion. All of the imports cited have decreased compared to 2016.

### ► LEADING DESTINATIONS OF AUTOMOTIVE EXPORTS FROM FRANCE

Sources: Customs data processed by CCFA

## PASSENGER CARS BY ENERGY (DIESEL, HYBRID AND ELECTRIC, ETC.)

In 2017, the market share of new diesel passenger cars continued its strong decline, down 28% from the 2012 record of 386,000 units. This ratio thus reached 47% (-5 percentage points compared to 2016) while it was higher than that of other energies since 2001. This broad movement is explained by objective factors: taxation less favorable to diesel, over-enrichment of diesel engines following the evolution of standards, development of the offer of 3-cylinder petrol engines and also by more subjective factors (Volkswagen problem in the United States, announcements of municipalities in France, etc.).

In Western Europe excluding France, the record level (52%) of diesel passenger cars was reached in 2011; since then, the latter has fluctuated around 51% for 4 years, before falling sharply in 2016 and especially in 2017 to now 44%.

Hybrid and electric engines are emerging in France, with respective market shares of 3.9 and 1.2%. In Western Europe, development is slower for electric motors (0.9% of the market) while that of hybrids accelerated in 2017 (+1.2 percentage points to 4.1%), thanks in particular to Germany, Spain, Italy and the United Kingdom. The ratio of electric passenger cars is 0.2% in Eastern Europe and close to 0% in Greece.

Source: CCFA

In 2017, France is now in fourth place on the European market for diesel engines for new passenger cars, with one million registrations, behind Germany (1.3 million units), Italy and the United Kingdom (1.1 million units each).

In terms of the number of cars on the road in France, 61% of the cars in circulation on January 1, 2018 were equipped with a diesel engine. This ratio has decreased by almost 2 percentage points since the high point of 2014.

In Western Europe, diesel penetration in the new passenger car market has decreased (-5 percentage points to 44%), i.e. 6.3 million units. In 2017, excluding Europe, the market share of

diesel cars is more than 40% in India, a stability compared to 2016, but down 18 points in five years, and it grew by about 20 points in South Korea since 2011 to reach 38% in 2017.

In 2017, 2 million diesel passenger cars were produced by the French groups, an increase of 2% compared to 2016 (-16% compared to the record level of 2004), compared to a 28% increase of that of the other engines. French groups also supply diesel engines to other brands as a result of cooperation agreements.

In 2017, registrations of new hybrid passenger cars totalled to 81,600 units, i.e. an increase of 40% (+60% for rechargeable). New electric

passenger cars rose by 15% to 24,900 units. The growth of these sales is supported by the Government's Automobile Plan of July 2012. To meet the needs of this type of car, 8,320 charging stations open to the public, representing 22,308 recharging points, were installed in France at the January 1, 2018 according to AVERE. French groups have developed a range of products (Renault Zoé, Citroën C-Zero, Peugeot iOn). The French market is the second largest European market for electric passenger cars, behind that of Norway.

## NEW PASSENGER CAR REGISTRATIONS BY MODEL, RANGE AND BODY STYLE

The economy and low range, predominant in France, peaked in 2010 thanks to the bonus-malus system and the scrap incentive scheme. Then, a slight decline occurred. Subsequently, the renewal of the economy range of cars (108, C1, Twingo, ZOE), the success of models from the existing low range (208, C3, Clio, Sandero) and the development of the product offering 4WD, SUV on this range (C4-Cactus, 2008, Captur, Duster) stimulate this segment whose share decreases but remains above more than 50% (40% on average in Western Europe in 2017).

4WD, SUV continued their strong growth (+23 percentage points since 2010 to 32%), building on the mid-range offer (C3 Aircross, DS7, 3008, 5008, Kadjar, Koleos). On the other hand, over the same period, sedans (-10 percentage points at 51%) and multipurpose vehicles (-8 points at 11%) seemed to lose their appeal. As for station wagons, their demand is less fluctuating and they still occupy about 6% of the market.

The share of higher-end models was 20% in 2017 compared to 15% in 2010. They have benefitted in particular from the demand from companies, and French groups can rely on proven models (Espace, Talisman).

### ► MAIN NEW DIESEL PASSENGER CARS RANKINGS IN 2017

## USED PASSENGER CARS

In 2017, registrations of second-hand passenger cars achieved a new record at 5.7 million units (+0.6%). Sales have surpassed the 5 million threshold since 2000.

Each year, two or three second-hand cars are sold for every new car sold: as a percentage of all passenger cars in use, around 17% of vehicles change hands each year. Since 2012, the used/new ratio has been oscillating around the very high level of 2.8, well beyond levels observed during previous periods of contraction of the new car

market in 1993 and 1997 (2.5).

Households kept their vehicles almost five and a half years on average in 2015 (compared to five years in 2010 and four in 1995).

The share of vehicles over 10 years old registrations was 44% in 2016 compared to 37% in 2010 because of longer cycle life.

The passenger car is a long-term purchase that households buy, use, maintain and possibly re-sell on the second-hand market.

Second-hand cars can be sold via car dealers or directly between private individuals. Professionals generally concentrate on 'newer' second-hand cars, i.e. under 5 years of age, around 60% of the total market.

Between 5 and 6 million second-hand cars are traded per year. This market is subject to longer cycles than the new car market. In 2017, demand for new cars increased by 4.7% to reach again the 2.1 million units threshold, and for second-hand cars by 0.6% to 5.7 million units. The used/new ratio decreases slightly to 2.7. Demand for second-hand cars is generally closer to the trends on the overall number of cars in use, and is less influenced by economic factors than the demand for new cars. It is, however, sensitive to measures introduced to stimulate the new car market (bonus-malus system, scrap incentive scheme, etc.).

The ageing of the vehicle stock and the growth of multi-car households has resulted in an increase in the share of cars aged 5 years and older in second-hand transactions (67% in 2017 vs 48% in 1990). Furthermore, the share of cars over 15 years old has more than doubled since the beginning of the 2000s and increased by 6 percentage points compared to the pre-crisis period to level, at 21% in 2017.

Second-hand cars less than one year old can be considered part of the new car market. Indeed, they are often initially been registered by a dealer (demonstration car or rental car), and then sold on to private individuals. They accounted for 518,000 registrations, i.e. 25% of the new car market, which is 2 percentage points above the 2012-2016 average, but above all higher than during the years when the scrap incentive scheme was in progress, and new car prices were more competitive. From 2001 to 2009, the share of cars under one year old as a proportion of all registrations of second-hand passenger cars reduced constantly and

represented around 8% since 2010 (12% in 2001).

The share of diesel in second-hand cars was less than 65% in 2017, i.e. a decline of almost 4 points since 2012, half since 2016.

In 2017, 58% of cars owned by or available to households were purchased second hand, compared to 51% in 1991. For cars purchased, this share rose to 60% in 2017. At the time of purchase, the average mileage was around 68,000 kilometres and more than one quarter of vehicles purchased second hand by households had more than 100,000 kilometres on the clock.

## NEW VEHICLE REGISTRATIONS IN FRENCH OVERSEAS DEPARTMENTS (DOM)

The annual markets for new vehicles in the five overseas departments (Guadeloupe, Guyana, Martinique, Mayotte and Reunion Island) continued their sharp rebound with a 14% increase in 2017 to 75,000 units, i.e. 2007 record level. They were around 60,000 units in 2013 and 2014, a decrease of 20% compared to 2007. Like in metropolitan France, the share of the diesel market is decreasing; it went from 64% in 2012 to 40% in 2017. That of electric cars amounts to 0.6%.

The share of commercial vehicles over 5 tonnes as a proportion of all registrations was lower in those territories (1.1%) than in Metropolitan France (2.2%), given the geographical context. However, the share of light commercial vehicles was practically the same (16.2% compared to 16.8% in metropolitan France).

French groups have to deal with intense competition on the market for passenger cars in those territories. Their market share was 45% then it evolved around 51% before reaching 53% in 2017 thanks to the integration of Opel in the PSA group from August 1, 2017. They occupy 57% of the market for light commercial vehicles (up 3 percentage points compared to 2014), which remains much lower than in mainland France (about two-thirds of the market). In the narrow market for heavy trucks, Renault Trucks' market share, up sharply to 32% in 2017, is higher than that observed in metropolitan France.

The registration of second-hand passenger cars totalled 123,000 units in 2017, 28% up on 2009 (96,000 units), but 5% down from 2016. After oscillating around 2,3 between 2012 and 2016, the used/new ratio drops to 2.

NEW PASSENGER CAR REGISTRATIONS IN FRENCH OVERSEAS DEPARTMENTS

FRENCH MANUFACTURER MARKET SHARE IN FRENCH OVERSEAS DEPARTMENTS (NEW PASSENGER CARS)

PASSENGER CARS: USED/NEW RATIO

## NEW LIGHT COMMERCIAL VEHICLES IN FRANCE

In 2017, registrations of new light commercial vehicles are again dynamic (+7.0% after +8.1%) and exceed the pre-crisis level of 2008 with 440,000 units. This increase stabilizes the average age of the fleet of vehicles in use around 9.5 years in 2017 (it was 8.5 years in 2010).

Diesel vehicles dominate (95.7% of the fleet), increasing for 10 years (+11 percentage points since 2008). However, for the last 3 years, a very slight decrease in new diesel registrations has been observed in favour of petrol and electric vehicles.

In 2017, the fleet of new light commercial vehicles reached 6.17 million units (+1.1%). The share of vehicles under 5 years old increases for the first time since 2008, from 30% to 31%; 42% of the park is over 10 years old.

### ► BREAKDOWN OF LIGHT COMMERCIAL VEHICLES BY WEIGHT

	2005	2010	2017
<b>&lt;1.5T</b>	2.9%	4.3%	0.7%
<b>1.5T TO &lt;2.5T</b>	56.3%	52.2%	45.1%
<b>2.5T TO 3.5T</b>	40.5%	43.0%	53.8%
<b>&gt;3.5T TO 5T</b>	0.2%	0.5%	0.3%
<b>TOTAL</b>	<b>100.0%</b>	<b>100.0%</b>	<b>100.0%</b>

Light commercial vehicles are defined as vehicles of less than 5 tonnes gross vehicle weight rating (GVWR), allowed for carrying goods. In many sectors (agriculture, construction, services, etc.), they are also used to come and go at work, to transfer between sites, to transport equipment. They come in different categories: passenger cars derivatives, multi-purpose vehicles, small vans, vans, pickups and 4WD, SUV.

In 2017, new van sales continue their strong growth (+33% since 2010) to reach more than 40% of registrations. Pickups have been growing strongly, especially since 2015 (+60% since 2015), but still represent only 2.1% of sales. While passenger cars derivatives accounted for one-third of registrations in 2000, they now account for only 19%.

Since 2016, new light commercial vehicles from 2.5 to 3.5 tonnes are the majority in the registrations; their share reached 54% of sales in 2017 (+17 percentage points over the last 15 years) while that of vehicles from 1.5 to 2.5 tonnes

went from 59% in 2002 to 45% in 2017. Since 2010, sales of vehicles from 2.5 to 3.5 tonnes grew by +31% while sales of all other categories declined.

In 2017, the registrations of second-hand light commercial vehicles regained a high level around 798,000 units (+8.1%). However, the used/new ratio remains below 2 for the second year running, due to the rise in sales of new vehicles, a level well below that observed for passenger cars. Indeed, for a new passenger car, between 2 to 3 used cars are sold (2.7 in 2017).

Specific French, 8% of new commercial vehicle registrations are made by individuals who prefer pick-ups and vans in their purchases; 40% of the fleet was maintained by individuals in 2011, according to an SDES survey. The average age of their vehicles is higher than that of professionals (in 2011, 13.1 years against 6.6 years respectively).

Light commercial vehicles are vehicles that are used intensively: they travel each year more

than 16,000 km/year against 13,000 km/year on average for a passenger car (Source: CGDD circulation report). While individuals travel fewer kilometres with their light commercial vehicles (around 10,000 km/year), some sectors are very intensive users and reach 20,000 km/year or more: transport, courier, storage, and specialised activities (scientific and technical, administrative and support services) and manufacturing. These vehicles are mainly used in urban areas or on the road (off-highway). The courses of over 150 km accounted for only 10% of the kilometres travelled in 2010 by professionals.

## CHARACTERISTICS OF NEW LIGHT COMMERCIAL VEHICLES IN FRANCE

French groups are traditionally more present on the light commercial vehicle market than that of passenger cars. With the opening up of markets in Europe, as happened on the market for passenger cars, their market share has reduced in France but has increased amongst our European neighbours. In 2017, sales of French groups represented 64% of the total market for light commercial vehicles in France, a market share that has been in decline since 2005 (down 6 percentage points).

French groups are reference manufacturers and also manufacture for their partners on their production sites (Renault for Fiat, Nissan and Daimler; PSA for Toyota). Production in France, wholly by French groups, represented 2% of global production in 2017, i.e. 479,000 units, 81,000 of which were for partners, i.e. 17% of total production.

MARKET SHARE OF FRENCH LIGHT COMMERCIAL VEHICLES BRANDS ON THE FRENCH MARKET

► RANKING OF MAJOR NEW COMMERCIAL VEHICLES IN 2017

Brand	Model	2017	Market share

Source: CCFA

CO<sub>2</sub> CONSUMPTION IN G/KM OF LIGHT COMMERCIAL VEHICLES - BASE 100 IN 2000

Sources: MTES/SDES, CCFA calculations

TRAFFIC IN FRANCE BY TYPE OF VEHICLE (IN BILLIONS OF VEHICLE-KILOMETRES)

The production of light commercial vehicles now represents 21% of total production of light vehicle production in France (compared to 16% in 2013). Light commercial vehicles are high value-added products that are more easily manufactured in France.

Thanks to the sales successes of their models (Renault Kangoo, Citroën Berlingo, Peugeot Partner), French groups are particularly dominant on the small van sector (87% of sales on this

market) as well as passenger car derivatives (83%) (Renault Clio, Peugeot 208), whilst the pick-up market is dominated by foreign groups (97% market share). Concerning the biggest market, the van segment, competition is tougher: French groups represent 60% of the market, which is up 2 percentage points since 2010.

In a context where everything is expanding: traffic (+30% since 2000), vehicle stock (+21%), and vehicle size, the increase in CO<sub>2</sub> emissions has

been restricted to 20%. Improved energy efficiency has seen CO<sub>2</sub> emissions in g/km fall by 8%. The electric light commercial vehicle stock, although small, was estimated at 40,000 units on January 1, 2018 – and is progressing (+38%).

## HOUSEHOLD VEHICLES IN USE

In 2017, multi-car households represented 39% of all households compared to 26% in 1990 and 16% in 1980; this share has slightly increased for two years (+1 point).

93% of households in rural or peri-urban areas (rural areas near to cities) have a vehicle.

65% of households in the Paris area have cars. In other French urban agglomeration, the rate is closer to 80%.

62% of modest households (less than €15,000 income per year) are equipped with at least one car.

83% of households between 65 and 74, as well as 75% of those over 75, have cars. Possession of a driving licence and the proportion of drivers in this age category continues to grow.

74% of under 25 have cars, compared to 65% in 2010 and 49% in 2000.

The rate of possession of a driving license among people under 25 does not decline: it is around 65% among 18-21 and around 85% among 22-25.

Sources: INSEE until 1993, KANTAR TNS PARC AUTO since 1994

The rate of car ownership can be measured by the percentage of households having at least one car. After several years of decline, the increase observed in 2016 in this rate is confirmed in 2017 (+1 point since 2015).

It is largely linked to the income, the age of the head of the household, socio-professional category, geographical area and the number of people in the household.

- 20% of the highest-income households had a car ownership rate above 90% in 2015. Regarding the 20 % of the lowest-income ones, 60 % had at least one car.

- The rate of car ownership in cities with over 100,000 inhabitants increases in 2017 (+1 percentage point compared to 2016): 83% had cars in 2017 compared to 75% in 1995. After a slight decline in 2016, this ratio is returning to growth in Marseille (84%) and Lyon (81%) areas; it remains at a high level in the Paris area (65%)

thanks to the rise of the rate of ownership; it decreased slightly in the Lille area (79%), while remaining at a high level.

- Rural households, large families and workers are those recording the highest levels of car ownership. Their rate of car ownership is as an average at more than 90%.

- The category of office workers and non-workers (including retired) are relatively less well equipped, but since 2000 their rate of ownership has grown substantially (+3.2 and +7.7 percentage points respectively).

Since 2010, the proportion of "demotorised" households has grown each year by 2-3%. However, this increase seems to have halted in 2017 at around 57% of non-motorised households. The change in family situation (death, divorce, etc.), the cost of purchase and maintenance, health problems, public transport alternatives and parking problems are the main causes. Amongst

non-motorised households, 14% are thinking of buying again over the next two years, which is stable over time.

## HOUSEHOLD VEHICLES IN USE

After steadily declining until 2014, daily use of the car stabilises: the share of vehicles on the road used daily or almost daily reached 74% in 2017, compared to 79% in 2000.

The share of vehicles used for the home-to-work run continues to exceed 50%. In 2017, business travel other than the home-to-work run stood at 16%. For travel linked to the school and baby-minding run, the share was 23%.

Cars on the road are ageing slowly and regularly, except during periods when market levels are high, like at the beginning of the 2000s or when the scrap incentive scheme was introduced.

Households keep their vehicles longer and longer; the average period of ownership was 5.6 years in 2017 compared to 4.4 years in 2000 and 4.1 years in 1995.

The average mileage per car on the road was around 106,000 km, i.e. 13,000 km more than in 2000 and 37,000 km more than in 1990. Average mileage for diesel cars, which are used more and more each year, has increased to 125,700 km (+15,000 km since 2000); petrol cars are used less intensely and are down to 77,800 km (-5,000 km since 2000).

Note: Years after 2007 cannot be compared directly with previous years; the scope of light commercial vehicles has been enlarged.

(1) Since 2017, Opel is integrated within PSA group.

Sources: INSEE until 1993, KANTAR TNS PARC AUTO since 1994

The PARC AUTO survey, conducted by KANTAR TNS every year, provides a detailed description of vehicles on the road, which are owned or available to households.

The total number of vehicles on the road is made up primarily of passenger cars, but also light commercial vehicles which represent around 4% of the total number.

The share of vehicles over 5 years of age was 68% in 2017 and that of over 10 years has stabilised at a record level (33%). The average age of the vehicle stock according to energy type is 9.1 years, rising due to the aging of the diesel cars stock (8.8 years on average, i.e. +2 years in 10 years). The one for petrol has decreased by one year since 2014, reaching 9.4 years.

The share of multi-car households equipped exclusively with cars aged 5 years and over was 47% in 2017, compared to 43% in 2010.

The most popular fiscal power ratings are between 2 and 5 HP. Cars from the low and mid-low range

categories have been in favour and their share of the total stock has remained high compared to high-end vehicles: they represented 49% and 29% respectively of the vehicle stock in 2017, compared to 7% for cars from the mid-high range. The share of cars of the "others" range, composed mainly of 4WD, grows strongly (+3.4 percentage points since 2015).

Comfort features are increasingly present. In 2017, the majority of cars (80%) had an air conditioning system. For safety equipment, rates continue to rise; now more than half of the cars in the park have a speed limiter (54% in 2017, compared to 48% in 2015); a third are equipped with an emergency braking system (36%), a recoil radar (35%) or an electronic trajectory correction (31%). On-board connectivity and "Stop&Start" is emerging and represents 36% and 21% of the vehicle stock respectively. The rate for all these elements is much higher for the main cars of multi-car households.

Concerning driving frequency, more than 80% of rurals and inhabitants of small towns use their

vehicle regularly. In Paris area, regular use is only 50%, and tends to decrease in Paris intramuros and the first crown. On the other hand, in the other big towns, the use is intensifying: nearly 7 out of 10 households regularly use their cars in 2017.

## DOMESTIC PASSENGER TRANSPORT

**+1%**

**Increase in 2017 in domestic passenger transport in all mode, expressed in passenger-kilometres**

Personal mobility is a social and economic necessity which allows exchanges between individuals, as is a source of wealth and job creation.

Expressed in passenger-kilometres and limited to domestic transport, the road is the primary means of transport of individuals and its share remains stable in 2017: 80% for the passenger car and 6% for buses, coaches and trams.

The private car but also the light commercial vehicle, is used for door-to-door mobility. They cater to a large number of individual constraints (the elderly, children, disabled, transport of heavy or bulky objects) and provide a suitable solution in low-density housing areas or where flows are not sufficient (shift work) for public transport to be a good solution from an economic or societal point of view.

In 2017, domestic passenger transport grew by 1%, a rate equivalent to its annual average since 2010, after two years of stronger growth (+1.9%). This deceleration is linked to that of passenger car

mobility, which after having increased sharply in 2015 and 2016 (+2.2% and +2.4%) to a record level, mechanically slowed down in 2017 (+0.4%), also probably slowed down by rising fuel prices.

Public transport increased sharply in 2017 (+3.4%), but in a contrasted way from one type of transport to another. Public transport by road fell by 1.3%, probably impacted by the increase in fuel prices and foreign travellers' switch to air and rail. Rail transport reported a sharp increase (+6.4%) after a dip in 2016, stimulated in particular by SNCF's commercial policy focusing on new product ranges and lower prices. Finally, air transport increased by 4%, probably linked to the arrival of new low-cost airlines and the return of foreign tourists.

In billions of passenger-kilometres

Base 100 in 1990

Individual mobility is of course linked to the economy, as is freight transport, but also comprises a social dimension, i.e. bringing people together, which remains a crucial element.

Whilst freight transport is more of a productive industrial, artisanal or agricultural function, individual mobility clearly covers a much broader economic scope.

Whilst home-to-work travel is the foundation of it, the development of the economy – including the tertiary sector – relies on individual mobility. This situation is accentuated in the case of services to individuals in the areas of health, tourism, etc.

The determining factors in the choice of type of transport, for the transport of merchandise, include origin-destination, distance, time and

quantities/volumes of merchandise transported. These choices now being impacted by the digital economy that has given rise to the development of new individual transport services.

Individual transport for each mode of transport requires major investments which are generally written down over a long period for the construction and maintenance of infrastructures.

When mobility is expressed in passenger-kilometres, light vehicles come out dominant in domestic passenger transport. When expressed in terms of the number of daily trips, and in particular in dense urban areas, where public transport and other modes of transport (bicycles, motorcycles, etc.) may play a major role, or in passenger-kilometres for long-distance international travel, each mode of transport appears pertinent and

complementary.

Domestic passenger transport expressed in passenger-kilometres, related to the number of inhabitants, progressed steadily between 1990 and 2002 (+1.1% per year). Subsequently, primarily because of the increase in the price of fuel, a ceiling seems to have been reached and an average dip of -0.5% per year was recorded between 2002 and 2013. Finally, since 2014, domestic passenger transport per inhabitant grew on average by 1% per year, mainly related to the increase in individual mobility, particularly in 2015 and 2016.

## DOMESTIC FREIGHT TRANSPORT

Freight transport is the drive-belt of the economy: it physically links together merchandise production sites, and those sites to the point of consumption, and then those points of consumption to reprocessing and recycling sites. As well as these geographical dimensions linked to territorial planning, there is also the notion of time.

Road freight transport ticks a number of boxes in favour of modal transport. Its share in the freight transport remains stable (around 85% of tonnes-kilometres covered) and distances under 300 kilometres stand out, making the transfer to modal transport more difficult: 50% of tonnes loaded under the French flag are delivered fewer than 50 kilometres away in 2017.

Between 2010 and 2015, road transport of merchandise fell by 1.3% on average annually,

in line with the decline in the activity of French operators (-2.6%/year), whilst foreign operators increased 0.8% each year. In 2016, it bounced back with +2.5% growth and its increase accelerated in 2017 (+6.5%) thanks to the increase in the foreign operators (+5.6%), but also the recovery of the French operators (+7.5%), following the economic recovery. However, activity remains below its pre-crisis level of 2008.

Rail transport rose again in 2017 (+2.7%), after a year of decline in 2016 (-4.9%). Between 2011 and 2017, rail freight transport fell by an average of 0.4% per year and its market share is now only 9.3%. Similarly, river transport fell by 1.8% in 2017, following a drop of 8.4% in 2016, a decline of 2.6% per year on average since 2011.

DOMESTIC FREIGHT TRANSPORT IN FRANCE

In billions of tonnes-kilometres

BREAKDOWN OF FREIGHT TRANSPORT USING FRENCH CARRIERS ACCORDING TO THE LOAD DISTANCE IN 2017

Demand for freight transport is closely linked to the country's economy and its interactions with other nations; on the one hand it corresponds to domestic demand from the different economic actors involved and on the other, exports of companies producing in the country. Also, some countries, like Germany and France, because of their geographical position, are key areas for the transit of freight. In road freight transport, this translates into a phenomenon of cabotage but also, over recent years, the arrival of foreign players who are taking increasing market share from the French operators.

Physical transfer of freight and goods exported by a country is one of the routes to competitiveness of an economy. Amongst other things, the cost must not be too high, compared to other countries, so as to facilitate export activities. Thus, the social and fiscal cost on the road mode, whether common law or specific (fuel tax), should not differ too much from that prevailing in other European countries, in order to cope with the competition and facilitate export activity.

The destination and type of freight or goods exchanged are criteria which are often decisive in the choice of modes of transport. Liquids can be transported by road, thus avoiding unloading and reloading, and ports are used, amongst other things, for trade with distant lands.

Domestic demand from the different economic actors concerns a wide variety of freight and goods. It is satisfied by national (auto)production

or by imports, and transport allows the production sites to be linked up physically between them, and then with sites of consumption, and finally with reprocessing and recycling sites: in France in particular, spatial planning policies play a major role.

Because of the great variety of freight and goods, numerous factors come into play and shape the choice of modes of transport. Such is the case for:

- the weight of freight: automotive manufacturers transport their spools of steel mainly by rail or river;
- the value of freight and goods transported;
- delivery time: perishable goods such as fresh products must be transported quickly, and are therefore primarily transported by road;
- the departure and arrival point of freight; as much during the production phase linked with spatial planning as during the consumption phase. The latter is primarily in urban areas, because that is where people mostly live.

Also, different modes of transport require the efficient use of infrastructure, which means substantial investment, generally written off over long periods. Intensive use, i.e. massification of flows, becomes all the more pertinent in this respect. The same applies if, during the transport chain, several modes of transport are used because in particular of unloading and reloading between different modes of transport.

Because of its ability to use the convenient routing facilities of the road network, its flexibility, its capacity for adaption and quality of service,

road freight transport meets all these criteria, which show that transport is not a homogenous ensemble but a multitude of sub-markets, which in most cases is difficult to replace. Thus, modal transfer is not possible for most freight flows, in particular over the final kilometres, or because it extends transport distances too much. Good inter-modality is based on an acceptable economic cost and efficient transfers between the different modes of transport.

Apart from the geographical position of the departure and arrival points, two main factors are used to measure the freight transport: per tonne at the time of loading and tonnes-kilometres. The road remains dominant in freight transport with a stable 85% share of tonnes-kilometres completed. The road freight transport survey carried out by the Transport Ministry shows the predominance of distances under 300 tonnes-kilometres: 50% of tonnes are transported by French hauliers over distances under 50 kilometres and 50% of tonnes-kilometres under 300 kilometres.

## ROAD TRAFFIC

Having increased by 2% on average between 1990 and 2004, traffic remained practically stable until 2012 (+0.2% per year). Since then, however, it has grown sharply (+1.2% on average), with a big jump in 2015 (+2.2%) and 2016 (+2.5%). It is up 1.1% in 2017.

In a context of higher fuel prices and record traffic levels, the circulation of passenger cars and buses and coaches rose slightly in 2017 (+0.5% and +0.1% respectively). This quasi stability results in particular from a decrease in the average journey per vehicle. The circulation of foreign buses and coaches fell sharply (-8%).

On the other hand, the circulation of light commercial vehicles and heavy trucks registered

in France accelerated in 2017 (+3.3% and +1.8% respectively) thanks to the recovery of the economic activity. In the same way, the circulation of foreign heavy trucks continues to grow (+5% after +3.4% in 2016) with the recovery of European growth.

At the end of 2017, over 40% of the passenger cars on the road met Euro 5 or Euro 6 standards. For heavy trucks, the percentage of trucks respecting Euro V and Euro VI standards was almost 50%. Their presence in traffic is all the more virtuous as these newer vehicles are used more than older ones.

### ► OVERVIEW OF ROAD TRAFFIC

(1) Including vehicles registered abroad and motorcycles  
Sources: MTES/SDES/CCTN

Road traffic is estimated by cross referencing information from vehicle accounting on the different road networks (national, county, local and urban) with annual average kilometre distances covered by vehicles on the road and fuel consumption data, including vehicles registered abroad.

In 2017, the number of cars registered in France grew 1.1%, i.e. at a faster pace than the one observed in recent years (+0.7% annual average since 2011), but lower than that observed during the 1990s.

The decline in diesel engine popularity was confirmed in 2017. Globally, for light vehicles,

its share in the vehicle stock fell 0.6%, and that in traffic as a whole by 1.1 percentage points to 78.3%. Four out of five petrol-driven vehicles are now compatible with super unleaded 95-E10, which represents 39% of total petrol supplies.

In 2017, the reduction observed over the past ten years in average unitary consumption on cars has come to an end. The continuous improvement in technical performance no longer outweighs the impact of the resurgence of petrol-driven vehicles in new registrations and the attraction for SUVs. Between 2006 and 2016, average unitary consumption on diesel cars fell 7.6% and on petrol cars by 6%.

Heavy trucks returned to growth in 2017 (+0.6%) after 15 years of decline. The Euro VI standard, which came in to force on January 1, 2014, goes some way to explaining the increase in heavy trucks fuel consumption. Another factor explaining the rise is the regular increase in gross vehicle weight (GVW) for heavy trucks.

## ROAD TRAFFIC AND CO<sub>2</sub> EMISSIONS

Since 1990, traffic of French and foreign vehicles in France has increased by 44%; the associated CO<sub>2</sub> emissions, net of renewable energies, have only increased by 10%.

Different factors explain this improved energy efficiency. The drop in unitary average consumption of passenger cars registered and in use in France (including the effects of over-consumption linked to biofuels) was more than 22% over the period 1990 to 2016 (dieselisation of cars on the road, manufacturers and drivers' efforts and the impact of the bonus-malus scheme introduced in 2008). In 2017, this downward trend was interrupted, particularly because of the increase in the share of petrol vehicles in registrations since 2013 and in the park since 2016.

Energy efficiency in merchandise transport continued to improve. The quantity of CO<sub>2</sub> emitted by heavy trucks to transport 1 tonne of merchandise per kilometre in France fell again by 3% between 2016 and 2017 and has fallen 32% since 1990. This improvement is primarily explained by improved vehicle performance (better engine performance, bigger vehicle size, allowing massification), optimisation of logistics (better fill rates, fewer returns empty), and the dissemination of good eco-driving practices.

**TRAFFIC IN FRANCE AND CORRESPONDING CO<sub>2</sub> EMISSIONS NET OF RENEWABLE ENERGY SOURCES**

Sources: CITEPA, MTES/SDES/CCTN

**AVERAGE CONSUMPTION OF A PASSENGER CAR ON THE ROAD (1)**

(1) Unit consumption includes the overconsumption effects associated with biofuels.  
Sources: MTES/SDES/CCTN

**CHANGE IN TRANSPORT ENERGY EFFICIENCY (2)**

(2) Energy efficiency relates to the change in the amount of CO<sub>2</sub> emitted in order to transport one ton of goods (or a passenger) one kilometre by heavy truck (or passenger car) driving on French roads. The reduction of CO<sub>2</sub> emissions due to the use of biofuels is taken into account.  
Sources: MTES/SDES, calculs CCFA

Numbers of private cars on the road result from two components: vehicle stock and annual average mileage. Over the long term, the growth rate of the vehicle stock has fallen sharply after the access-to-vehicle mobility phase. The development of multimotorisation and then substantial increases in fuel prices are the major factors behind the drop in annual average mileage between 2000 and 2012. Since, there has been an increase in the growth rate of the vehicle stock and in annual average mileage, in a context in a context of recovery of economic growth

In 2017, new estimates provided by the Centre Interprofessionnel d'Etudes de la Pollution Atmosphérique (CITEPA) for road transport reported net CO<sub>2</sub> emissions from renewable energies at 122 million tonnes. After the ceiling reached in the first decade of the 21<sup>st</sup> century, around 130 million tonnes, a net fall was recorded between 2004 and 2009, linked amongst other things to the effects of the economic crisis. Since, CO<sub>2</sub> emissions have stabilised at around 120 million tonnes, thanks to energy efficiency improvements.

In 2016, CITEPA estimates net CO<sub>2</sub> emissions from renewable energies used in road transport were broken down as follows: 56.6% for cars, 20.1% for light commercial vehicles, 22% for heavy trucks, including coaches and buses, and 1.2% for two-wheelers.

## NEW USES FOR THE AUTOMOBILE

Changing technologies, economic constraints and peoples' understanding of environmental challenges have, in several sectors, promoted the development of new consumption trends and lifestyles which privilege the use, to the detriment of ownership, of goods.

In transport, this trend has materialised in the development of new uses for the car, promoting sharing and mutualisation leveraging information and communication technologies. These new practices include car-sharing, car-pooling, transport services with drivers, as well as rental between private individuals.

As surveys show, the main motivation for sharing car is cost. Sharing a personal vehicle reduces usage and maintenance costs and meets the demands of household buying power.

A shared car in a densely populated area is also a useful complement to public transport (for transporting heavy or bulky loads, or for shift-workers), whilst improving the fill rate of cars, with inherent positive effects on the environment and fuel consumption.

In rural and peri-urban areas, car-sharing and car-pooling also increase transport possibilities at a lesser cost to the authorities because it requires almost no new infrastructure.

Automotive manufacturers now include these new forms of mobility in their development strategies through industrial cooperation projects, investments in companies linked to mobility and development of car-sharing services.

MAIN REASONS FOR CAR-POOLING

SURVEY ON CAR-POOLING OVER THE PAST 12 MONTHS

Source: PARC AUTO KANTAR TNS survey

Source: PARC AUTO KANTAR TNS survey

### CAR-POOLING

Car-pooling is defined in the energy transition law for green growth as 'the shared use of a terrestrial motorised vehicle by a driver and one or more passengers, without a fee but on a cost-sharing basis, on a journey the driver would have made anyway. Connecting these people up, to this end, can be a service for which there may be a fee.' (Art. L. 3132-1).

There are several car-pooling practices, differentiated by the way people get in touch, the frequency of journeys or the distances covered. Car-pooling crews can gather informally or via a third party using a website or telephone service. Car-pooling is called 'dynamic' when it is done in real time using information and communication technologies.

The dissemination and development of car-pooling is difficult to measure. According to different surveys, 5-10% of the French population car-shares regularly, but the figure is rising rapidly. The

2018 PARC AUTO KANTAR TNS survey indicates that 3.9% of people questioned had already used car-pooling for home-to-work trips over the past 12 months, 9% for journeys over 100 km and 6.8% for distances less than 100 km. In all, 14.3% of people questioned had used car-pooling during 2017, i.e. a figure slightly lower than 2015 (15.7%).

The last survey performed for the ADEME in 2015 shows that car-pooling is progressively becoming a transport solution in its own right, with the average age of the car sharer (33 years) increasing, and no longer exclusively used by young urban-dwellers, but also in rural areas and by older people. For 69% of carpoolers, the main motivation is still cost.

Occasional car sharing – generally over long distances (364 km on average) – is now more structured. Link-up platforms enable transactions between drivers and passengers. Thus, according to PARC AUTO survey, the percentage of long journeys organised with a hook-up structure increased from 25% in 2012 to 59% in 2017. On the other hand, 93% of home-to-work trips and

82% of short trips were organised without any structured platform. Indeed, regular car sharing – mostly over shorter distances – in particular for commuting, is more difficult to organise. However, players are investing in this segment.

Companies are also increasingly involved in the framework of the Companies Travel Plans, in order to facilitate the networking of their employees. Mobility operators or local authorities are also involved through the provision of information or carpooling areas.

### CAR-SHARING

Car-sharing is defined in the Grenelle II law (article 54) as the sharing of a vehicle or a fleet of vehicles for terrestrial motorised transport for users subscribed to or accredited by an organisation fleet manager. Each subscriber or accredited user can access a vehicle without driver for a trip of his choice and for a limited period of time.

In the case of commercial car-sharing, the vehicles belong to the company providing the service. Each subscriber can have access to a fleet vehicle by reserving it via an app on the internet or by telephone. The vehicle rented is equipped with an onboard computer and a satnav system, and the doors are opened using an RFID card or the user's smartphone.

'Looped' services where having reserved, the customer takes the vehicle from a station and

then returns it to the same place afterwards, are differentiated from 'direct route' systems where the customer drops the vehicle off at the place of his choice. The two systems cater to different periods of use and different needs.

So-called 'free-floating' services also exist, whereby vehicles are made available within a limited area of a conurbation, more generally in a dense urban area, without the pick-up and drop-off points being limited to specific stations. French groups have developed offers abroad, especially in Madrid, with local partners.

In France, an increasing number of cities have self-service car systems. The latest national car-sharing survey (6t/Ademe) identified 26 car-sharing services either in round trips or direct routes in 2016. The Autolib' service, developed in 2011 in Paris and in more than 90 communes of Paris area, reached, in January 2017, 109,000

active subscribers (one-year subscription), with 3,946 electric vehicles in service at 1,097 electric vehicle stations. But this type of service is for a minority of users who, according to the "national car share survey" (2016), are older (45 years old on average), better qualified (73% have a baccalaureate +3 years or more) and financially better off than the populations of the big towns in which they live.

The economic model of these new services remains vulnerable and they are coming into competition with new services like those offered by VTCs (transport services with drivers).

## NEW USES FOR THE AUTOMOBILE

SHARE OF TAXIS AND TRANSPORT CARS WITH DRIVER IN THE OFFER OF PUBLIC TRANSPORT OF INDIVIDUALS IN 2016 AND 2017

Note: Preliminary data for the number of taxis in 2017.

Source: National Observatory of Special Public Transport of People, CGDD, July 2018

### TRANSPORT SERVICES WITH DRIVERS (VTC)

The VTC business is part of the individual public transport sector (T3P), as defined by the transport code, which also includes taxis and two- and three-wheeled motorised vehicles which are commonly called "moto-taxis".

Since their arrival in France at the beginning of the second decade of this century, VTC services have contributed to increasing mobility by offering transport services for individuals by pre-order. However, their rapid development has raised a number of questions as to their legality and their competitive stance versus taxis, which has led the public authorities to review existing legislation.

Originally, VTC status was inherited from the "voiture de grande remise" status and the "Grand Remisier" professions: drivers of luxury tourism vehicles. In 2009, this regime was transformed by the Novelli law, which deregulated the sector and created the status of "tourism vehicle with driver". The Thévenoud (2014) and Grandguillaume (2018) laws brought in new regulations governing VTCs, which are now called "transport cars with driver", to better define the contours of the profession.

And so today, the VTC business is subject to particular set-up and operating conditions that distinguish them from taxis.

- The vehicle used must meet certain "top-of-the-range" criteria; a throwback to its luxury tourism car past. The vehicle must have between four and nine places (including the driver), be less than six years old (excluding vintage vehicles) and comply with certain technical characteristics (size, power).
- The driver has to obtain a professional VTC card, having passed an examination at the end of a VTC training course, and sign up to the national VTC operator register.
- The customer has to reserve the vehicle. The vehicle therefore cannot park or drive on the public highway looking for customers, or be hailed by customers in the street, as this activity is reserved to taxis. Electronic pick-up via geolocalisation applications allowing customers to locate available vehicles is

forbidden to VTCs and reserved to taxis.

- The price of the fare is totally deregulated, contrary to taxi rates, which are regulated and fixed by government decree.

The national observatory on individual public transport (Observatoire national des transports publics particuliers de personnes) created in 2017, is responsible for drawing up an inventory of the sector, and did so for the first time in 2017. It shows that 15,000 VTC drivers were registered in 2016 (i.e. 22% of the T3P product offering) and that figure jumped to 26,000 in 2017 for 56,000 taxis, i.e. 32% of the individual public transport offering (T3P). This increase is the consequences of the Granguillaume law, which requires drivers to sign up to the register before December 31 to continue their business. The observatory also indicates that the VTC offering is the highest in the Ile-de-France area, which accounts for 80% of what is available nationally, compared to one third of taxi services.

### RENTAL BETWEEN PRIVATE INDIVIDUALS

More recently, sharing vehicles outside the private sphere has also developed via a car rental service between private individuals. Rental is secured on specialised websites which connect up people who do not know each other. It allows private individuals to pool their vehicle against payment and thereby optimise vehicle ownership and maintenance when it is not being used.

According to the KANTAR TNS PARC AUTO survey, 10% of households having used rental services in 2017 (i.e. 7% of the sample) rented from private individuals, which still makes it a very marginal solution for the population as a whole, and more than 96% of people questioned have neither the intention of making their vehicle available for rent, nor renting one via a platform for rental between private vehicle owners.

According to an annual CNPA report, this activity represented 6% of total short-term rentals (in number of days) in 2016, compared to 3% the year before, and 5% of licence holders have already used it. Users tend to be young (44% are

under 35 years of age), and less often in work than customers of traditional agencies (70% compared to 83%), and less well-off: 47% are from the upper socio-professional categories, i.e. 10 percentage points fewer than those using more conventional rentals.

## THE AUTONOMOUS AND CONNECTED CAR

# 51

### Authorisations

**Experimentation of vehicles with driving delegation delivered between the end of 2014 and the end of 2017**

New technologies allow driver functions to be delegated for different types of vehicles and different vehicle applications: private vehicles, public transport vehicles, freight and logistics vehicles.

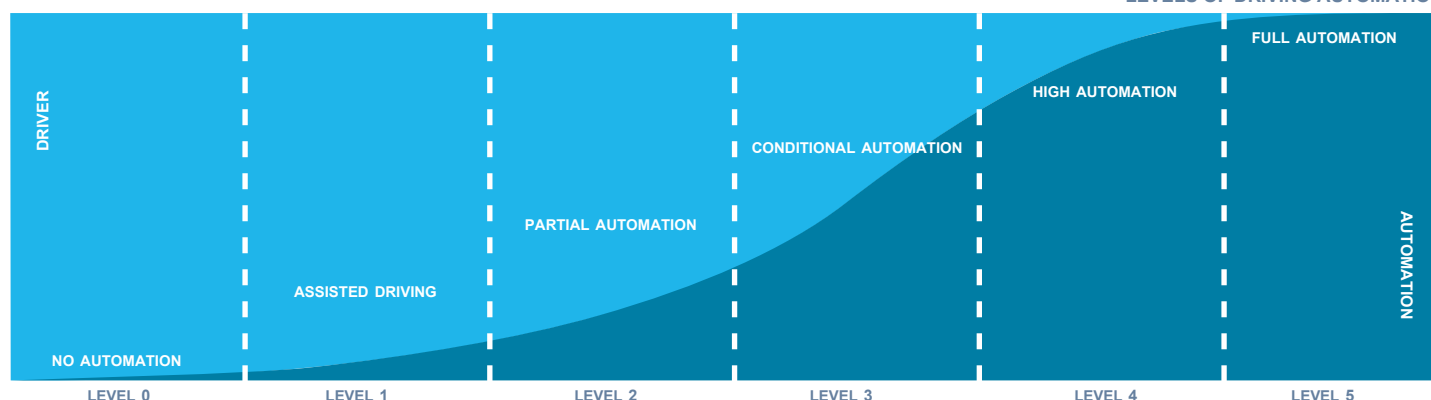

The connected vehicle is based on communication and information sharing between vehicles, as well as between vehicles and the road infrastructure or communication infrastructures. It is equipped with Advanced Driving Assistance Systems (ADAS) with a view to improving driver safety and comfort, and managing infrastructures and the environment. Several national and European projects such as SCOOP@F, Interco and C Roads for example, are under way.

An autonomous vehicle is one equipped with on-board intelligence systems that relieve driving tasks under certain conditions and which, once fully developed, will be able to move around on the public highway automatically without the user intervening.

On the graduated scale of automation from 1 to 5, 1 and 2 level vehicles are already available on the market.

The challenges encompassing the development of the autonomous vehicle are many: improving road safety, making traffic more fluid, and promoting economic driving. Connectivity and autonomy will also facilitate mobility with the development of new mobility services to accompany the ecological transition.

LEVELS OF DRIVING AUTOMATION

Automation levels were defined by SAE J3016.

Levels of driving automation	DEGREE OF SURVEILLANCE	LIMITS
<b>LEVEL 0</b> NO AUTOMATION	Total.	No limit.
<b>LEVEL 1</b> ASSISTED DRIVING	The driver must monitor the system constantly.	The system is not able to detect the limits of all of its capabilities. Responsibility of the driver.
<b>LEVEL 2</b> PARTIAL AUTOMATION	The driver must monitor the system constantly.	"Non-driving activities are not permitted. When the system identifies its limits, the driver must be able to regain control of the vehicle."
<b>LEVEL 3</b> CONDITIONAL AUTOMATION	The driver does not have to monitor the system constantly. Non-driving activities are allowed on a limited basis.	The system identifies the limit of its performance, however it is not able to bring the system back to a minimum risk state for all situations. As a result, the driver must be able to regain control of the vehicle within a certain period of time. Emergency situations can be taken into account by the system, provided that it can be relayed by a human driver.
<b>LEVEL 4</b> HIGH AUTOMATION	The driver does not have to monitor the system constantly. Non-driving activities are permitted at all times during the use case.	The system identifies the limit of its performance and can automatically cope with any situation that arises during the use case. At the end of the emergency, the driver must be able to regain control of the vehicle.
<b>LEVEL 5</b> FULL AUTOMATION	The driver is not required.	The system identifies the limit of its performance and can automatically cope with any situation occurring during the entire journey.

### Issues and uses

Connected to the infrastructure and to other vehicles, the driverless vehicle must optimise travel time, fuel consumption, improve road safety by anticipating road events that present a risk and provide more comfort for users, freeing them up for other tasks than driving. The automation of vehicles, a process already under way through driving aids, enhances driver comfort, road safety and vehicle maintenance. Nevertheless, its acceptance by users however will depend on how the fundamental challenges of improving road

safety are addressed to optimise infrastructures, reduce environmental impact and improve mobility.

The prospects for driverless vehicles are multiple, and concern different types of vehicles in different situations: cars, trucks, buses, shuttles; driving on a fluid motorway or at low speed in congested traffic, automatic valet services, small collective vehicles, flow management vehicles in logistics centres or areas, pelotons of urban shuttles (balancing out car-share parks). For long distance road transport of merchandise, convoys of heavy

trucks could see driverless trucks following a lead vehicle driven by a guide driver.

## THE AUTONOMOUS AND CONNECTED CAR

### The support of the public authorities in the development of autonomous connected vehicles

The French government has committed to an ambitious approach to develop autonomous vehicles with the objective of securing French leadership on the market. The national strategy on automated vehicles, presented in Anne Marie Idrac's report in May 2018, "Development of autonomous vehicles – strategic orientations for public initiative", establishes the roadmap for developing the autonomous vehicles in the years ahead, putting the emphasis safety requirements that have to be met before commercial roll-out. Auto sector players have come together and entered into a strategic contract with the State covering its industry that includes a specific programme on the development of an autonomous vehicle and the promotion of real-life testing.

For such experiments, the French public authorities are proposing to adopt measures to authorise them under safe conditions, including the prospect of driver inattention or absence. These experiments on "highly-automated" vehicles (levels 4 and 5) are crucial to guaranteeing road safety in and securing buy-in from users and members of the public.

A regulation framework is also planned to allow use of autonomous vehicles by 2022 and to ensure conditions of access to connected vehicle data, required to enable the development of mobility service provision.

The government's road map for the development of 5G frequencies, published on July 16, 2018, brings strong impetus to moving ahead with the use of connected autonomous vehicles.

Also, the international and European legal framework, in particular the Vienna convention of 1968 (see box below), is currently being adapted to allow autonomous vehicles to be developed. Clearly, some of its provisions are unsuited to current technologies available and requirements imposed by innovation and new mobilities.

According to the terms of the Vienna Convention of November 8, 1968, only driver-controlled vehicles are authorised to use roads and the driver must be able to "neutralise or deactivate" said vehicle, worded in the Convention as follows:

- Every moving vehicle must have a driver (§ 8.1); every driver shall at all times be able to control his vehicle (§ 8.5); a driver of a vehicle shall at all times minimize any activity other than driving (§ 8.6);
- Every driver of a vehicle shall in all circumstances have his vehicle under control (§ 13.1).

### General experimentation framework

In France, the Order of August 3, 2016 subjects the experimental road use of partially or totally automated vehicles on a highway open to public traffic to prior authorisation from the transport minister. In application of the Decree of March 28, 2018 and the Ruling of April 18, 2018, applicants

for such authorisations are required to present a file detailing the conditions under which the experiments are implemented and how security is ensured.

### Experimental programme

A programme of experimentations was introduced with the emphasis on rationalising feedback and implementation all over the country. They will be deployed gradually: (i) first of all with professional drivers, (ii) and then with ordinary drivers under the supervision of professional drivers, (iii) and finally with ordinary drivers, without supervision, for experiments on shuttles, vehicle robots, passenger vehicles or freight transport. The last category covers highly-automated vehicles and will be performed by drivers without supervisors or without supervisors ready to take back control but with a remote experimental supervisor.

Experiments on "highly-automated" vehicles (levels 4 and 5) are crucial to guaranteeing road safety in and securing buy-in from users and members of the public. These experiments, which are designed to be rolled out in the final phase, are necessary to: (i) show and technically validate the safety of the autonomous vehicle; (ii) prepare future regulations, with a view to vehicle accreditation, (iii) assess the socioeconomic effects expected from the introduction of autonomous vehicles. In reality, the assessment of the safety of a highly-automated vehicle depends on experiments alone, given the fact that it is impossible to establish reliable comparisons with other types of transport (rail, air), which are substantially less subject to unforeseen external forces.

### Some examples of experiments

#### "EVRA"

A call for experimental projects on an autonomous road vehicle (EVRA), designed to support experimental projects targeting the different uses of autonomous vehicles coming onto the market by 2022 (level 3), will be finalised before the end of the year. It seeks to create an eco-system for the roll-out of automated vehicles (consortium combining manufacturers, transport operators, regional authorities, infrastructure managers, and research laboratories) sharing a vision of the challenges faced and results expected (including the notion of "shared asset").

### THE EXTENDED VEHICLE (EXVE) AND ITS STANDARDISED INTERFACES

Source: ACEA

### SYMBIOZ

Renault group and Sanef group launched a pilot project in June 2016 to study the behaviour of autonomous vehicles on approach to toll barriers and roadwork sections. This experiment is currently underway in Normandy on the A13 motorway, using connected infrastructure, with the Renault SYMBIOZ prototype (an autonomous, electric, connected vehicle equipped with a level 4 autonomous driving capacity, also called "Mind off"). It is being tested in normal traffic flows, and includes the crossing of toll sections in autonomous mode.

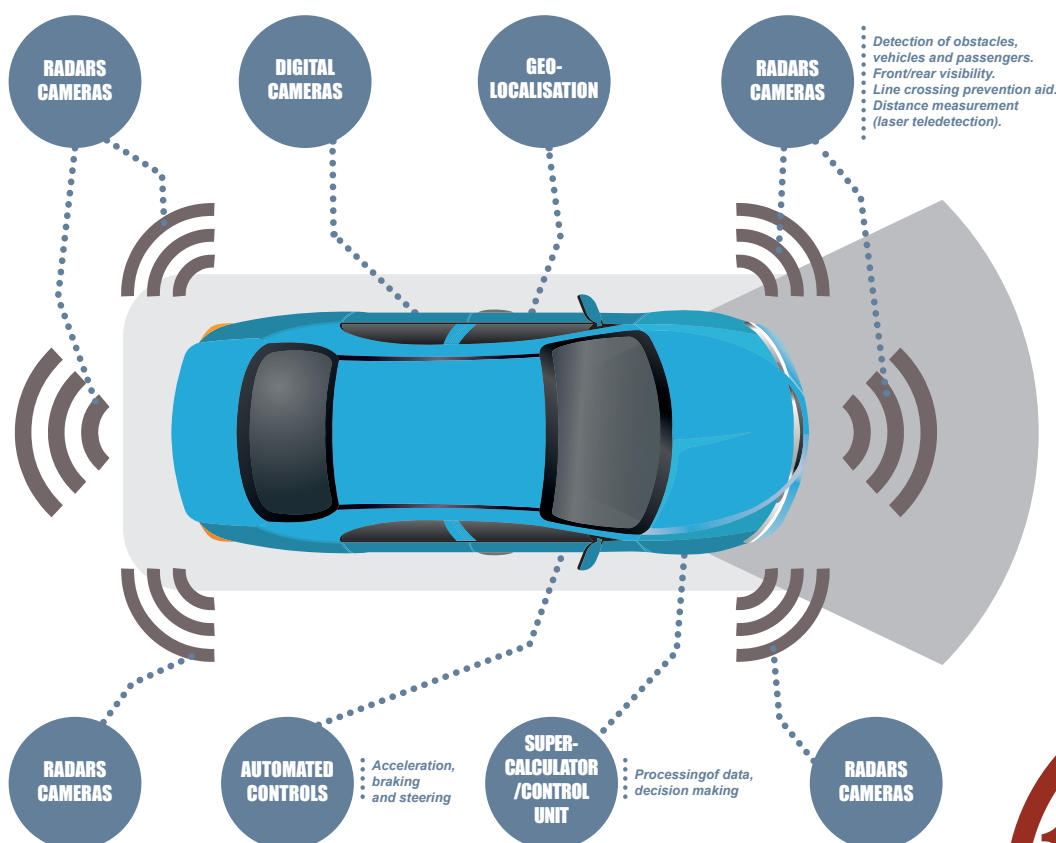

### SCOOP

This is a European pilot implementation project for the roll-out of cooperative intelligent transport systems, i.e. based on the exchange of information between connected vehicles and between the vehicle and the road. The vehicles are equipped with detectors to pick up on events (slippery road, impacts, sudden breaking, etc.) and on-board units which send information to the vehicles upstream (V2V) as well as to the operator (V2I), via roadside units. The operator can thereby send information (on roadworks, etc.) to the on-board units in the vehicles (I2V). The project involves numerous public and private partners working with its coordinator, the transport ministry: local authorities, road operators, car manufacturers PSA and Renault, universities and research centres. SCOOP is looking to deploy 3,000 vehicles over 2,000 km of road scattered around five sites: Ile-de-France, A4, Isère, the Bordeaux ring-road, and Brittany. One of SCOOP's objectives is to improve road safety, worker safety for those who intervene on roads for roadworks and other road-management operations, make traffic management more efficient and contribute to reducing emissions, optimise infrastructure management costs, prepare the vehicle of the future and roll out new services.

## THE AUTONOMOUS AND CONNECTED CAR

### ► EXAMPLES OF ONBOARD INTELLIGENCE SYSTEMS FOR AUTOMATED DRIVING

**100,000 km**

**Covered in France as part of autonomous vehicle experiments and no recorded material or personal accident**

#### First real-life tests with 5G connected cars

Manufacturers, including PSA, Qualcomm and Savari, have carried out several demonstrations on the Montlhéry circuit of C-V2X technology and its various applications. PSA provided the cars whereas Qualcomm provided the 5G communications platform and Savari the C-V2X communications software. Six different applications were presented: anticipation of emergency braking, risk of collision on approach to an intersection or bend, presence of a slow-moving or stationary vehicle, changing traffic lights and anticipation of a pedestrian crossing the road.

The French automakers are also working together within the VEDECOM institute (advanced research), IRT SystemX (electronic and cyber security architecture) and UTAC CERAM, to perform experiments on connected tracks with reconstitution of driving conditions on motorways and in the urban setting.

#### The question of access to data

The use of connected and autonomous vehicles is subject to a whole set of progressively evolving rules. They focus on the management of data surrounding automated vehicles which can exchange information with the environment: a major personal privacy challenge. In this respect, European regulations on personal data protection

(GDRP), which came into force in May 2018, is intended to enhance the protection of personal user data. European regulations on cyber security and cooperative intelligent transport systems are also key contributors. This mechanism is supplemented by “flexible” legal rules with standardisation (ISO) and a CNIL compliance pack on connected vehicles.

The “extended vehicle” (ExVe) is a concept that the auto manufacturers, in league with the major equipment manufacturers and independent dealers, have been trying to standardise at international level (ISO) since 2014. The concept is based on the idea of taking into account the extension of the now very connected vehicle's field of action (mobility services, repair and maintenance diagnostics, entertainment, etc.) with the impact that such an extension implies in terms of system integrity and safety.

Extended vehicles standards enable a system that is coherent, responsible and interoperable in terms of its management of vehicle data:

- Coherent, because it involves a joint standard that every company will need to respect and because it avoids a multiplication of heterogeneous access systems which would lead to a multiplication of risks in terms of safety for property and individuals.

- Responsible, because they limit the chances of vehicle functions being compromised (steering, braking, etc.) for all situations encountered, whatever the external solicitations, including malevolent ones (the issue of cyber security).

- Interoperable, because the creation of an internationally applied and supported standard means cross border data management systems will be inter-compatible.

The development of connected autonomous vehicles is therefore a new challenge for the auto market. As emphasised in Cédric Villani's report of March 2018, “Giving a meaning to artificial intelligence”, the acceleration of artificial intelligence has a key role to play in the ecosystem and must contribute to the industry's innovation and digital transformation by structuring it around the main mobility challenges of the future.

## PASSENGER TRANSPORT PRICE INDEXES

After two years of decline, the price index for private vehicles (purchases and use) increased sharply in 2017 (+3.3%). Over the period 2009-2016, prices have therefore increased at +14%.

In the road transport of people, we are witnessing a sharp rise in prices in 2017 (+3.1%) after the slowdown observed in 2016. After a period of "price war" with the opening to competition of regular transport by coaches (called Macron coaches), there is a high concentration of players in 2017 and an upward adjustment of prices. Prices in the air transport sector are also rising in 2017. This increase is linked to the increase in the price of fuel and the level of airport taxes and charges.

Over the past five years, real price indices for the different forms of passenger transport have shown very differentiated trends: from +9% for road passenger transport (excluding taxis) to -2% for private vehicles, via a 5% drop for air travel and a 6% rise for rail transport.

# +3.3%

# +3.1%

Respective price index variations in 2017 for passenger cars and passenger transport

### ► ANNUAL VARIATION IN PRICE INDICES FOR DIFFERENT PASSENGER TRANSPORT MODES (AS A %)

	Passenger cars	Passenger rail transport	Passenger road transport (buses, coaches and taxis)	Including passenger transport by buses and coaches	Including passenger transport by taxi or transport services with drivers	Passenger air transport (1)
2005	4.6%	2.8%	1.3%	0.4%	3.5%	-0.5%

2017	3.3%	0.65%	3.1%	4.1%	0.6%	2.4%

### PASSENGER TRANSPORTATION FORMS PRICE INDEXES

Base 100 in 2010

(1) The methodology for calculating the price index for air transport services changed in January 2012. The variation between 2011 and 2012 cannot be considered to be significant.  
Source: INSEE

The price indexes of the different forms of passenger transport reflect price trends including VAT. Thus, for air travel, they include airport taxes; the same applies to other means of transport, taking account of infrastructure charges up to a level that can be incorporated in the sale price. Also, only the part directly paid by the household is monitored. For example, if a region or local authority decides to subsidise some of the cost linked to transport as part of a spatial planning exercise or social policy, a drop will be recorded in household expenditures. Surcharges for fuel are incorporated into the monitoring of the index for air passenger transport.

Rail and road passenger transport indexes primarily concern inter-urban connections. The indexes for private vehicles was created taking into account both the cost of purchase, but also their use. To identify actual price changes in these main means of transport, the different indices are corrected using the general consumer price index as illustrated in the graph above.

Having stayed close to the 1995 level, the real price indexes of the different forms of passenger transport have seen a variety of trends since 2003: between 2003 and 2017, the real indexes for personal vehicles (purchase and use) increased

by 11%, exceeding by far its 2000 level. That of rail transport increased by 15%, continuing its progression begun in 2000, whilst passenger transport by road (excluding taxis) fell by 12%; it is important to remember that only the portion that is paid directly by households is taken into account.

## FREIGHT TRANSPORT PRICE INDEXES

In 2017, freight transport prices are up in all sectors, compared to the average levels observed in 2016, with the exception of air freight, where prices have fallen until the third quarter, but much less strongly than before (-0.9% in 2017). River freight prices stabilised in 2017 (+0.3%) after three years of decline. Same trend for rail freight where after 3 years of decline, prices rise slightly in 2017 (+0.6%), in connection with the recovery of prices in national transport (+1% compared to -1.6% in 2016), while international ones stagnated (+0.2%). Finally, in road freight transport, prices increased by 1% in 2017, in particular due to the increase in interurban freight transport (+1.8%) while local freight is stagnating (+0.2%) and international transportation rose by 0.8%.

Since 2006, the road transport freight price index has risen on average +1.1% per year, ranging from +1.4% for local transport to 1% for interurban transport. Over the same period, the river transport price index rose more timidly (+0.1% per year), ranging from +0.4% for international to +0.7% for domestic. For rail transport, the price index has only been available since 2014 using data going back to the first quarter of 2012. Over the period observed, there was a fall of 1.3% primarily due to lower national rail prices (-1.7%), whilst international rail prices increased 1%. Since opening to competition in 2006, the new operators have grown and now account for 40% of the volumes transported, a level comparable to that of Germany.

FREIGHT TRANSPORT INDEXES IN FRANCE

FREIGHT TRANSPORT INDEXES IN FRANCE: ROAD

FREIGHT TRANSPORT INDEXES IN FRANCE: RAIL AND FLUVIAL

(1) 2006-2009: very high volatility of maritime freight price indexes. The index increased from 110.1 in Q2 2006 to 195.5 in Q2 2008, before falling back to 79.1 in Q1 2009.  
Source: MTES/SDES

Freight transport price indexes are calculated by the transport ministry's SDDES statistics department. For road, river and rail transport, these indexes are drawn up using the so-called "representative services methodology", defined according to loading and unloading site, type of merchandise and characteristics of the contract linking the shipper to the haulier. Prices are recorded on a quarterly basis. In road and river transport, only activities performed on behalf of third parties by companies domiciled in France, for whom freight is the main business, are monitored.

For rail transport, the price index, which has been monitored since the first quarter of 2012, is calculated on the basis of representative transport

services entrusted by a sample of 22 shippers to rail transport operators.

Air freight the price index is calculated according to freight services departing from France by air waybill. The service is defined by the point of unloading and the airline responsible for shipment. The index is drawn up using so-called 'unitary value methodology' which includes the excess charges for fuel and security, paid to the airline doing the shipping. It is in line with highly volatile fuel prices.

The maritime transport price index comprises transport services for third parties, performed by companies registered in France whose activity

is maritime freight (bulk and ferry). Calculations are based on international price indexes, unitary prices and tariffs. It is very volatile, in line with bulk price trends.

Concerning road freight, infra-annual variations are less substantial, compared to river or air, even though fuel does represent between 20 and 30% of total road freight transport as the CNR survey shows (see page 59).

## HOUSEHOLD MOTORING COSTS

According to the most recent 2011 "Family budget" survey, households dedicate on average 18% of their budget to cars (acquisition and use). The fuel item represents the largest car budget item accounting for 5.2% of the total. Cutting up income brackets by quintiles (fifths) shows that the least well-off households (Q1-Q3) dedicate a bigger portion of their budget (6%) than wealthier ones (4.3%). Similarly, rural households spend a larger share of their budget on this item.

Between 2006 and 2011, there were also changes to distribution patterns concerning the purchase item for new cars, which increased by 0.7 percentage points, and second-hand cars, which fell by 0.2 percentage points, which could be explained in part by purchases being made under the scrap incentive scheme in 2010-2011. For Q1-Q3 households, the increase in the share of the new cars item (+0.5 points) was almost

balanced by the dip in the used car item (-0.4 points).

According to Eurostat data, French households spend a bigger part of their budget on the car item than their European neighbours (+0.7 percentage points compared to the average across the Euro zone). This difference is a result in particular of the greater weight of the "vehicle purchase item" (+2 points) in their budget; it is the third biggest ratio behind Luxembourg and Finland. Concerning the other car budget items, there is little difference between the European countries, with the exception of the "maintenance and repair" item, to which French households dedicate a smaller portion of their budget (-0.5 percentage points compared to the average of the Euro zone).

**AUTOMOTIVE BUDGET : COMPARISON BETWEEN 2006 AND 2011**

**SHARE OF FUEL IN 2006 AND 2011**

**SHARE OF AUTOMOTIVE PURCHASING IN 2006 AND 2011**

**SHARE OF FUEL IN HOUSEHOLD CONSUMPTION, INCLUDING HOUSEHOLDS WITHOUT CAR, BY RESIDENCE AREA**

Source: INSEE, 2011 and 2006 Family budget survey

The "Family budget" surveys carried out every five years by INSEE give an idea of the share of the major consumption items in household budgets and provides data according to their characteristics: socio-professional category, age, income, category of commune of residence, etc.

In terms of automobile-related items, there are two major differences compared to national accounting. For the processing of vehicle insurance expenses, the whole amount is taken into account in surveys, whereas only the service (spending that is the least reimbursed) is accounted for at a macroeconomic level. For second-hand car expenditure, the whole amount is accounted for in the surveys, whilst at a macroeconomic level, the amount taken is more or less the margins of professionals involved at the time of a transaction, without taking trading between private individuals into consideration.

Some graphs show the distribution of the different automobile items as a percentage

of total consumption, equivalent to individual consumption excluding rents levied according to revenue, ventilated by population tranche of 20%: Q5 corresponds to the 5<sup>th</sup> quintile, i.e. 20% of households with the highest revenues, ahead of Q4 and the Q1-Q3 grouping.

In 2010-2011, the automobile budget for all households with cars represented 18% of their total consumption. The new car purchase item and second-hand car purchase item represent a little under half of that, varying from 7% for 60% of households with the lowest revenues to 9% for the 5<sup>th</sup> quintile. For Q1-Q3 households, almost 60% of purchases are second-hand cars (almost two thirds in the period 2005-2006), whilst almost two thirds are new cars for the Q5 group.

Whilst over 5% of total consumption is dedicated to fuel, the richest quintile dedicates a much smaller proportion to this item. The same phenomenon occurs for vehicle insurance. As these two items

are the most exposed to taxation, it therefore appears that households with cars belonging to the Q1-Q3 segment pay more tax for the privilege of using their vehicles, proportionate to their consumption, than households belonging to the top quintile.

When ventilated by category of commune of residence and for all households (with or without cars), the fuel item seems to get higher as the commune gets smaller. Thus, households in the Paris area dedicate almost 3% of their consumption to this, compared to more than 6% in rural communes.

## ROAD FREIGHT COST PRICE

**23.5%**

**Share of professional diesel in the CNR index for long-haul road merchandise transport costs in 2017**

According to the national haulage committee (CNR), long-haul and regional road merchandise transport costs increased in 2017 (+2.2% and +1.9% respectively), after having remained stable in 2016. This rise is explained clearly by the rise in oil prices and therefore the cost of professional diesel, which has had a greater impact on long-distance transport than regional transport.

Since the end of 2015, the share of professional diesel in the product cost of long-haul road freight transport rose again (+2.8 percentage points) and reached 23.5% at the end of 2017. Conversely, the share of driving staff has declined by one percentage point since 2016. The share of long-haul equipment ownership remained stable in 2017, following a slight decline last year.

ROAD FREIGHT COST PRICE STRUCTURE FOR LONG DISTANCE

ROAD FREIGHT COST PRICE STRUCTURE IN DECEMBER 2017

ROAD FREIGHT TRANSPORT COST PRICE

The national road committee (CNR) publishes, amongst other things, two indexes reflecting changes to the cost of long-distance and regional road freight transport.

Long-distance corresponds to national or international transport performed by a maxi-code articulated unit whose operating constraints mean that the driver's return home every night is either impossible or very difficult to plan.

Regional transport, which is performed using rigid trucks with a total weight between 3.5 and 19 tonnes, applies to transport within a region and across into neighbouring regions whereby the driver is able to return home every night.

The cost structure resulting from the CNR annual survey depends both on the evolution of each component and on the associated operating conditions (kilometres traveled, number of hours worked). Thus, an item can see its weight in the structure vary differently than the evolution of its unit cost can suggest. Here we are mainly interested in the evolution of the cost structure, which better reflects the reality experienced by carriers.

For long-distance road freight transport, the first

item of expenditure is personnel, and their share in the cost has been stable since 2001, at around 30%. The second item, professional diesel, initially accounted for a growing portion of the cost price to level out at 29% in 2011. From 2012 onwards, it fell on a regular basis to 20.7% in 2015. In 2016 and 2017, the rebound observed on diesel prices pushed up this share to 23.5%.

The share of equipment ownership (tractor and semi-trailer) remained stable in 2017 at 12.2%, after having fallen between 2007 and 2012 (11% at the end of 2011) then rising again between 2014 and 2016 with the rise in new vehicle prices, linked to the implementation of the environmental standard EURO VI on January 1, 2014 (around 10%) and the new mandatory safety equipment. The impact of these increases is diluted in the calculation of the cost of ownership by the gradual renewal of vehicles (about 1/6 of the fleet per year) and by the slight drop in prices observed on semi-trailers. In addition, in 2017, interest rates remain at historically low levels. On the other hand, the cost of car insurance, which also falls in the "equipment" item, rose by +1.7% in 2017.

After several years of decline, the maintenance cost index, which includes tyres and vehicle

maintenance and repairs, increases in 2017. Tyre prices are on the up and maintenance on Euro VI vehicles, applicable for 4 years, seems more expensive than for previous generations (example: exhaust with filtering particles). Despite this, the weight of the maintenance item remains stable in 2017, at 8.2% of the total cost. Finally, the "infrastructure" item continued to increase in 2017 (+0.2%), reaching 6.7% of the total cost.

In regional transport, the share of driving staff continues to decline in 2017 to reach 40.3% at the end of December. The cost of ownership of equipment, the second item of expenditure, stagnated in 2017 at 22.3% of costs. The weight of professional diesel comes third in the cost price of regional transport. After falling between 2011 and 2015 (-5 percentage points), it has risen by 2 percentage points since that date to reach 16.3% in 2017. Finally, repair maintenance costs stagnate in 2017 to 7.5% of the total.

## AUTOMOTIVE PRICE INDEXES

In 2017, the new car price index rose 1%, in line with inflation. This rise, which comes after a slight fall in prices in 2016, can partly be explained by the tightening of the ecological malus, which remained unchanged in 2016, while the bonuses, like in 2016, were revised downwards.

In 2017, the increase in oil prices led to a sharp rebound in fuel prices, which rose by 9.5% after falling by 19% between 2012 and 2016. The real price index, deflated by the general consumer price index, rose by 8.4% in 2017, after a 21% drop over the 2012-2016 period.

The price index for spare parts, accessories and vehicle repair and maintenance increased by 1.4% in 2017, following a 0.4% increase in 2016. As in 2015 and 2016, the hourly cost of labour for car repairs grew faster (+1.7%) than the other components of the index, tyre prices and vehicle accessories, which fell by 1.2% and 2.3%.

### ► YEAR ON YEAR AUTOMOTIVE PRICE CHANGES

	Consumer prices	New car prices	Prices of car parts, accessories, repair and maintenance	Fuel prices
2015	0.0%	1.1%	1.5%	-9.8%
2016	0.2%	-0.3%	0.4%	-4.5%
2017	1.0%	1.0%	1.4%	9.5%

Base 100 in 2000

### NEW PASSENGER CAR, FUEL, PARTS, ACCESSORIES, MAINTENANCE AND REPAIR PRICE INDEXES

### RETAIL PRICE OF DIESEL IN FRANCE AND THAT FOR JANUARY 1999, INDEXED FOR CONSUMER PRICES

### HARMONIZED PRICE INDICES FOR THE EURO ZONE (17 COUNTRIES)

The price index for new cars compares the price of cars with similar technical characteristics so as not to take into account price increases resulting from improved quality or equipment. It factors in promotional offers made occasionally (i.e. outside the private sales market), as well as the bonus-malus system.

To identify real price trends for the main items linked to cars, these indexes have been corrected by the general consumer price index in the above graph.

Between 1992 and 2010, the real price of new cars has declined on a regular basis under the continuous effect of competition and the occasional effect of measures to boost sales

(bonus-malus system and scrap incentive since 2008). Nevertheless, the tightening of the ecological bonus-malus scales, the implementation of new standards that increase the cost of pollution control and the introduction of new elements to improve road safety have contributed to price growth since 2011.

As for the real price index of repairs and maintenance, it started to climb again from 2003 onwards for various reasons linked to labour (the cost of work, development of skills, etc.) and parts (improved reparability, price of raw materials, improved service quality, greater diversity of models demanded by consumers).

In the euro zone (19 countries), Eurostat calculates a price index for the purchase of new and second-hand cars; the data from the different countries are then collated. Since 1996, the index trend compared to that of the general price index shows a high pressure phenomenon on prices linked to intense competition and limitations on households' buying power, as is the case for France. In 2017, the general price index was up 33% compared to 2000, whilst the price index for the purchase of new and second-hand cars was only up 16%.

## CONSUMER SPENDING ON PRIVATE VEHICLES

# 9.2%

**Share of vehicle purchases as a percentage of total household spending for 2017**

In 2017, households' gross disposable income increased 2.6% in value (after a 1.7% increase in 2016). At the same time, the price of final consumer spending increased strongly (+1.3% compared to -0.1% in 2016), mainly due to the rebound in hydrocarbon prices. The buying power of disposable income therefore slowed in 2017 (+1.3% after +1.8% in 2016) and the household consumer spending decelerates significantly in volume (+1% after +2.1% in 2016).

Vehicle purchases remained buoyant in 2017 (+4.2%) even though their growth slowed slightly compared to 2016 (+7.1%). It is mainly spending on new cars that is growing less rapidly, from +6.4% to +2.4% in 2017, to reach €26.6 billion,

i.e. €3.5 billion more than in 2014. Second-hand cars are still growing at a steady pace (+7.8% in 2017 compared to 8.5% in 2016) and now stand at €14.9 billion.

The share of vehicle purchases in household consumption rose to 2.9% in 2017, from a low of 2.6% in 2014, but remains well below the level observed in 1990 (4.5%). This strong erosion was to the detriment of the new vehicle, while the share of the second-hand vehicles progressed slightly.

In 2017, households' fuel expenditure rebounded strongly (+9.8%), in line with the price increase, to reach €36.9 billion

### AUTOMOTIVE BUDGETARY COEFFICIENTS FROM 2000 TO 2017

As a % of total consumer spending

(1) These are provisional data and can be readjusted for three years. Source: INSEE - Household consumer spending, 2017 - base 2014

### TOTAL VEHICLE RELATED EXPENDITURE

As a % of total households spending

According to national statistics – based on different fundamentals than those used for the Family budget survey (see page 58) – households in 2017 spent €147 billion (+5.4%) on personal transport. This sum represented 83% of all household expenditure dedicated to transport (individual and public).

The share of automobile consumption as a share of real national consumption is called the 'automotive budgetary coefficient'. This coefficient varied between 9% and 11% at the beginning of the 1990s until the 2009 crisis. Since, it has

vacillated around the 9% mark and was only 9.2% in 2017.

As part of this consumption group, the 'vehicle purchase item', which now includes the tax on registration certificates, is now in second place behind spending on vehicle upkeep (excluding fuel), whereas pre-2003 it was the biggest item of expenditure. The downward trend in vehicle purchases is affecting this budgetary coefficient, which was only 2.9% in 2017 compared to 4.6% in 1990. Purchases of new passenger cars account for only 64% of overall vehicle purchases,

compared to 82% in 1990.

The budgetary coefficient linked to maintenance and repairs of private vehicles, which had increased over the 1990s in line with the development of car ownership and the increase in the average age of vehicles on the road, has since 2008 decreased and is now stabilising at around 2.5%.

Expenditure on tolls, parking, rental and driving schools was up 2.8% to €16.3 billion in 2017.

## AUTOMOBILE FINANCING

In 2017, consumer credit rose for the third year in a row, driven by low interest rates and the good performance of car purchases. More than 60% of new cars purchased by households are paid on credit, more than half of which are financed by leasing.

The financing arrangements for new car purchases by individuals have changed significantly over the last four years, favouring rental arrangements to the detriment of conventional credit (or specific car loans). Since 2013, the number of credits allocated to the purchase of a new vehicle has decreased by 31% while the rental formulas have increased by 175%.

Thus, in vehicle credit, rental has become the dominant form of financing (55% of credit) ahead of specific car loans (37%) and personal loans (32%). Within the rental bracket, rent-to-buy is highly dominant (94% of rental financing) whilst rent without option to buy remained marginal.

For second-hand cars purchased by households, the cash purchase remained the main form of financing (almost 60%). The older the car and the younger the driver, the more it was used. However, the use of conventional credit for second-hand car purchases rose (+15% between 2013 and 2017).

The financing of business equipment in new vehicles (passenger cars, light commercial vehicles and heavy trucks) remained dynamic in 2017 with a number of funding applications (641,000) up 7% compared to 2016. Since 2013, rental without option to buy, dominated by the long term rental, grew by 34% compared to 24% for rent-to-buy. It now represents 60% of companies financing compared to 37% for the rent-to-buy.

**INTEREST RATES OF NEW CONSUMER LOANS TO INDIVIDUALS (NOT INCLUDING OVERDRAFTS, ANNUAL INTEREST RATE)**

**TOTAL AMOUNT OVER TWELVE MONTHS OF NEW CONSUMER LOANS TO INDIVIDUALS (EXCEPT OVERDRAFTS)**

New and second-hand car purchases use loan facilities if they cannot or do not wish to buy in cash.

There are three financing possibilities:

- Personal or bank loans granted by a bank or credit institution. The borrower is free to use his credit as he sees fit.

- Specific car loan or conventional credit; it is provided by financial companies, subsidiaries of manufacturers and importers, or by independent finance companies belonging to manufacturers and finance or banking subsidiaries or groups. It is used for a specific purchase.

- Rentals with option to purchase, also known as lease with promise of sale or leasing; it is a consumer credit that allows the disposal of a car against the payment of monthly fees during the lease period, which can be up to eighty-four

months, or seven years; the purchase option may be exercised during the lease or at the end of the lease.

- Rentals without option to purchase includes financial leasing and long-term leasing. These are operations without possibility for the tenant to become owner at the end of the contract.

Results from various sources (professional associations, statistics on registrations, surveys) allow calculations to be made on credit used for the purchase of new cars by households.

Having fallen between 2008 and 2014, the total number of new loans for private household consumption continued to progress with the steady decline in interest rates. After a 15% rise in 2015 and 12% in 2016, it rose another 9% in 2017 to reach a record level.

Using these forms of lending, the financing of

new passenger cars by private individuals was particularly buoyant in 2017. The number of credit applications for the purchase of a new vehicle increased +7%. The increase in the number of rentals with or without option of purchase applications increased again strongly in 2017 (respectively +23% and +31% compared to 2016) to the detriment of conventional loans, which fell 11%.

The renewal of vehicle stocks and fleet managers' recent interest in SUVs contributed to companies' high demand for vehicles. Companies vehicle purchases were still particularly buoyant in 2017 and the number of funding applications reached 641,000. In addition, the Syndicat National des Loueurs de Voitures en Longue Durée (the national syndicate of long-term rental companies – SNLVL) reports that the number of vehicle launches light vehicles in long-term rental grew by 4.8% in 2017 to reach a historic level of 508,648 vehicles.

## CAR AND MOTORCYCLE SALES AND REPAIRS

Trade in automotive vehicles in 2017 generated €92 billion turnover, up 5.9%, after having increased by 7.3% in 2016. Since 2013, the turnover grew by 25% to €18 billion. The recovery of new passenger car and light commercial vehicle registrations, which has been observed for the last 4 years, and sales, which are well oriented in the premium and luxury segments in 2016 and 2017, explain these good results.

The vehicle maintenance and repair business, constantly in decline since 2009 (-2% per year between 2009 and 2015), recovered strongly in 2016 (+3.9%) and 2017 (+4.4%), reporting turnover of €22 billion. The sector reaped the benefits of an aging vehicle stock (9 years in 2017 compared to 8.2 in 2010), linked to the downward trend in kilometres driven and the increasing reliability of cars.

### ► LIGHT VEHICLE SALES NETWORKS IN FRANCE ON JANUARY 1, 2015

Retail sales of automotive equipment also benefited from this trend and jumped 9.8% in 2017, following a 3.4% increase in 2016.

According to INSEE-Esane, between 2012 and 2015, margins (gross operating margin/ value added at factor cost) on motor vehicles were 9% on average and 17% for motor vehicle maintenance and servicing. The investment rate (tangible investment / value added excluding tax) was 10% for each of these sectors over the same period.

The concentration of companies can be found in automobile distribution groups' new vehicle (NV) sales statistics. Between 2001 and 2012, each distribution group from the top 10 each year sold on average more than 1,000 additional NVs. The 100 biggest each saw their sales increase by

300 NV per year. This trend is linked to improved geographical coverage and the development of multi-brand retail.

In 2016, the 10 biggest groups sold more than 350,000 NV, i.e. 15% of sales of NVs, for a turnover of €10.9 billion excluding VAT. The 100 biggest groups have crossed the symbolic threshold of one million new vehicles sold, i.e. 49% of total sales, for a turnover of €35.9 billion excluding VAT.

Source: INSEE - Trade Accounts, base 2010 of national accounts: provisional results

The automobile requires a very specific type of service: throughout its service life, and to maintain its initial characteristics, the vehicle requires attention at all times and in all locations to be serviced and repaired under the best possible conditions. According to the KANTAR TNS PARC AUTO survey, a car in use has an average of two maintenance-repair operations per year.

Cooperation between manufacturers, distributors and approved repairers is therefore very tight to provide warranty service, user safety, protection of the environment, availability of spare parts and information on technical changes.

To guarantee a high level of quality at the point of sale and through after-sales, auto-distribution networks rely on a selection procedure for distributors and repairers able to apply the exigencies of the brand and the level of customer service required. In terms of automobile repairs, there are also independent networks (in 2015: 14,400 automotive repair mechanics, 1,250 autocentres and 870 quick-repair centres).

**€92**  
BILLION

**Net turnover, in 2017, new record year, of automotive sales and repairs in France, according to INSEE**

## CIRCULAR ECONOMY

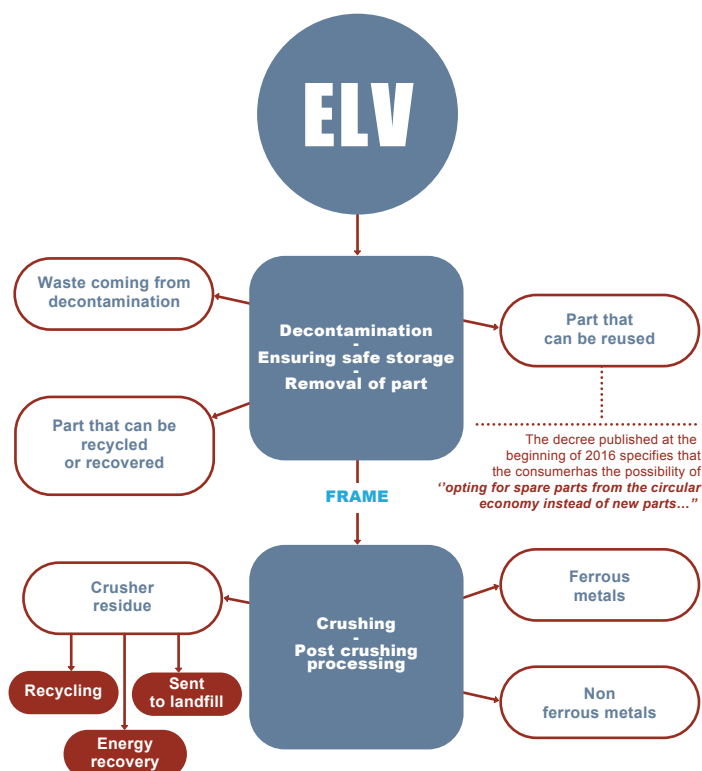

According to Ademe, the circular economy is defined as an economic system of trade and production which, at every stage of the product cycle life (goods and services), seeks to increase the efficiency of the use of resources and reduce environmental impact.

The circular economy in the automotive market concerns vehicles (private vehicles and vans in particular) and consumables (tyres, oils, batteries, etc.).

An End-of Life Vehicle (ELV) is transferred by the last owner to a third party for destruction. Around 1 million ELVs were processed by the accredited channels in 2016, compared to 1.5 million between 2009 and 2011 (the scrappage bonus scheme) and less than 1 million in 2007. Ademe measures the re-use and recycling rate of ELVs which has progressed by around 13 percentage points since 2010. This ratio is the sum of re-use and recycling and energy recovery.

### ► SIMPLIFIED CHART OF PROCESSING OF AN ELV

### NUMBER OF END OF LIFE VEHICLES (ELVS) DEALT WITH

### ELV REUSE AND RECOVERY RATE

Source: ADEME

In France, around 1 million vehicles were processed by the end-of-life vehicle channel in 2016 in around 1,700 approved centres, called 'ELV centres'. Their average age was 18 years in 2016.

The resale of second-hand spare parts maintains recycling ratios and contributes to ELV centres' financial performance.

The level of collection and processing of automobile components by the ELV centres varies according to the new vehicle market, the economic context, the use of schemes to promote the withdrawal of old vehicles and technical progress that reduces the frequency of vehicle component renewal.

The processing of end-of-life vehicles must respect predefined performance levels according to September 18, 2000 directive: 95% re-use, of which 85% recycling and re-injection, since 2015. Some sites already exceed this objective.

In 2014, the materials breakdown of ELV centres was: 75% metal (ferrous metals: 70%; non-ferrous

metals: 4%; and electrical harnesses: 1%), 12% plastics, 3% tyres and 1% batteries. The average weight of a passenger car is around one tonne (source: Ademe).

Some vehicle consumables (oils, batteries, etc.) are also recycled during the service life of the vehicle. In addition, manufacturers plan to use an increasing share of recycled materials, including some plastics such as polypropylene.

Keeping cars on the roads generates 200,000 tonnes of used engine oil each year. These used oils, which are collected free of charge by approved collectors are then recycled, only if they have never been mixed with other liquids (water, cooling liquids, solvents, etc.). The oils are then regenerated where possible (75% of volume), i.e. used for energy.

In 2016, the collection of accumulators (batteries designed to power the starter motor, lighting or the ignition system) reached the lowest level since 2009, i.e. 168,000 tonnes (-8% compared to 2015). The recyclability of lead accumulators is 81%.

Collection of car tyres (light vehicles and heavy vehicles) totalled 452,000 tonnes in 2016, up 10%. The collection rate reached 100% thanks to a rise of 4 points. The re-use rate of tyres was 94%. Around 46% of tyres were used for energy in 2016 (substitute fuel in cement works for example), 25% for granulation (for sports pitches, urban furniture) and 18% re-injected (14% for second hand sale and 4% for remoulding), 9% to public works.

Retreading is a technique allowing a used tyre to be fitted with a new rolling strip. Between 2013 and 2016, retreading of heavy goods vehicles tyres fell by half, in a context where imports, particularly from Asia, progressed by more than 20%.

## CIRCULAR ECONOMY

The energy transition law in favour of green growth of August 17, 2015 seeks to promote the market for parts from the circular economy by requiring maintenance and repair professionals to inform consumers of the possibility of opting for spare parts from the circular economy instead of new parts, in certain categories.

The May 30, 2016 decree specifies that parts from the circular economy are components and elements sold by approved ELV centres and components and elements reconditioned by the manufacturer (the manufacturer, for example), according to a precise specification, either in the manufacturer's factories or in a controlled workshop, branded with the 'reconditioned' label (decree of October 4, 1978).

Vehicles are launched by producers (manufacturers and importers) via a dealership network. At the end of the vehicle's service life,

it has to be handed over to an approved ELV centre to be processed according to a precise specification, according to health and environment regulations. The centre is responsible for depolluting parts (removal of fluids – fuel oil, brake fluid, air conditioning, etc. –, batteries and securing pyrotechnic devices), dismantling them for second-hand sale or recycling, and sending the stripped vehicle to one of the 60 car crushers (2016 data, Ademe), responsible for separating the remaining components from the body for re-use. The latter, when sorted, can be used again to make other products (recycling). If the components are not reused or recycled, they can be used for energy purposes (heating, cogeneration).

### ► COMPOSITION OF AN END OF LIFE VEHICLE IN 2014

Source: ADEME

# PRODUCTION OF THE AUTOMOTIVE INDUSTRY AND ITS ECONOMIC IMPACT

Production in the automotive field was €60 billion in 2016, i.e. a rise of 6% compared to the previous year. It is 16% above its 2013 level (€51 billion), last year of decline of the European market.

According to the new 2014 base, when research and development expenditure are now included in the gross fixed capital formation (GFCF), total purchases (or intermediary consumption), including the branch itself, represents more than three times its added value (AV). In 2016, this was €46 billion, which benefitted numerous sectors of the economy because of its stability.

Since 2010, AV has settled at around €13 billion, a level close to the mid-2000s. In 2016, it was almost stable after a rise of 5% the previous year.

As a guarantee of future production in a highly capitalistic industry, the investment rate (the GFCF/AV ratio) has been maintained at a high level over this period (see graph on page 30) during which European markets are getting closer to their current level, whilst the margin rate (the ratio between the gross operating margin and AV) rose for the third year in a row.

## ► ANALYSE DE LA PANALYSIS OF AUTOMOTIVE INDUSTRY PRODUCTION (AS A % OF TOTAL PURCHASES)

		2000	2005	2010	2014	2015	2016 (1)

Gross operating surplus (GOS)	Current € billion	-	-	-	4.9	5.7	5.9
As a % of value added (margin rate)	%	-	-	-	39.1	43.0	44.4

(1) These data are provisional.

(2) Total purchases (intermediate consumption) refers to the value of goods and services transformed or consumed fully during the production process. The distribution of purchases by industry is expressed by volume. Since 2010 the research and development costs are no longer included in intermediate consumption, but in GFCF. It does not include the depreciation of fixed production assets, which is recorded in uses of capital employed.

Source: INSEE – National accounts (base 2014 excl. years before 2010: base 2010)

Total purchases by the automotive branch, representing more than three quarters of production, can be broken down as follows: a little under 28% for the branch itself and the remaining 72% for other branches.

Purchases to “other industries” accounted for 37% of all purchases, amongst which metallurgy and

metal product manufacturing, which remain the leading suppliers (16% of total purchases, slight but steady decline).

Purchases to machine and equipment manufacturers (excluding electrical, electronic and IT products) accounted for 12% of the automotive industry's total purchases.

From a 2014 base, when research and development expenditure was first accounted for in the GFCF, the automotive industry dedicated 14% of its spending to the tertiary sector, compared to 13% in 2010. Some of these purchases were destined in particular to business support suppliers (with a relatively stable ratio at around 7.5%).

## AUTOMOTIVE OEMS AND SUPPLIERS

### MAJOR CLIENT

The French automotive industry is one of the three biggest industrial clients of numerous economic sectors such as plastics, industrial rubber and the mechanical industry

Vehicle manufacturing is a structuring industry for its suppliers and for the French economy.

The development of French manufacturing has a pull effect on equipment manufacturers and other suppliers from sectors such as plastics, industrial rubber, foundry, industrial metal services, etc.

In the 2018-2022 strategic contract for the

automotive sector (see page 32), the number of employees is estimated at 400,000 and the turnover at €155 billion.

According to Eurostat, vehicle manufacturing and the French equipment manufacturing industry ranked second and third respectively in Europe in terms of turnover.

#### ► WORKFORCE OF THE AUTOMOTIVE INDUSTRY BY ACTIVITY (IN THOUSANDS OF "FULL-TIME EQUIVALENTS")

#### ► SALES, VALUE ADDED AND EXPORT RATE OF THE AUTOMOTIVE INDUSTRY

	Sales before tax (in € billion)	Added value (in € billion)	Export rate (%)
Core (1)	91	12	56
Periphery (2)	52	12	35
Automotive branch	143	24	43
Ratio (branch/core)	1.6	2	-
Manufacturing industry	900	215	34
Weight of the automotive branch in the manufacturing industry	16%	11%	-

(1) Auto manufacturers, equipment manufacturers and bodybuilders.

(2) Metal products, rubber products, metallurgy, IT products, mechanical parts, glass products, textiles, etc.

Sources: DGE, 2012 survey of companies in the automotive industry; Insee Esane 2011; DGE calculations

A Direction Générale des Entreprises survey published in 2015 estimates that the industrial automobile sector (excluding research and development, and other services) employs 441,000 people "full-time equivalent", of which 211,000 in the core and 230,000 in the periphery (see definitions above). It assesses the turnover of the entire sector at more than €140 billion and its added value at more than €20 billion. Also, the export rate from the sector is greater than that of the manufacturing industry as a whole (43% compared to 34%). Within the auto sector, this ratio is higher for the core (56%) than for the periphery (35%).

According to FIEV (vehicle equipment manufacturers' federation), headcount of equipment manufacturers in 2017 was 70,000 for €18.7 billion turnover. Equipment manufacturers have two types of market: initial assembly, whereby equipment is delivered to the assembly line, and secondary assembly or replacement parts. The initial assembly turnover represents more than 80% for the total.

Over recent years, externalisation has resulted in an increasing use of suppliers, which services represent a high and growing proportion of the overall cost of manufacturing a vehicle (around 80% according to FIEV).

In 2016, amongst the other automotive suppliers, nearly one fifth of work in the plastics and electronic equipment sectors were for the automotive industry. Also, 10% of mechanical industries' domestic market was for the automotive industry. For forges and foundries, the total was 50%. This rate was 70% in the polymer and rubber sectors. Moreover, according to the Observatoire de l'Intérim (temporary work observatory), the automotive industry (excluding suppliers) accounted for more than 4% of total employment volumes in 2015 (in full-time equivalent).

The French automotive industry continues to rely on its French industrial base. It accounts for a substantial share of plastic technical parts, industrial rubber, foundry, industrial metal services businesses, which are made up in particular by

cutting, die stamping, industrial mechanics, bar turning, stamping, forging and metal surfacing. According to GIST (a group of mechanical sub-contractors), the automotive sector represented nearly 40% of its turnover over recent years. To express the total industrial value of the automotive sector, we would have to add the French automotive industry's purchases from other sectors such as steel (the automotive sector represents 25% of the tonnage), chemicals (10% for all transport materials) and energy (cf. page 66).

## EMPLOYMENT

# 8%

**French people in employment  
working in the automotive industry  
(direct and indirect jobs)**

In broader terms, 2.2 million people worked in activities linked to the automotive industry in 2017, i.e. 8% of the working population.

In the strictest sense, the automotive industry employed 213,000 people, i.e. around 7% of salaried jobs across industry (including extractive industries, agrofoods and industrial companies).

The impact of the crisis and the lack of competition severely affected industrial automotive activities, including upstream. However, it fades with the rise of the market. Concerning use, activities are by nature less sensitive because of their links with the automobile stock which continues to progress, nevertheless, the number of jobs has slightly decreased with the crisis, but in recent years a stage seems to have been reached.

### ► JOBS DIRECTLY OR INDIRECTLY RELATED TO THE AUTOMOTIVE INDUSTRY IN 2016 (IN THOUSANDS OF PEOPLE)

**GEOGRAPHIC BREAKDOWN OF AUTOMOTIVE INDUSTRY EMPLOYEES  
ON DECEMBER 31, 2015**

Source: INSEE

The automotive industry, one of the main contributors to industrial production in France, generated 510,000 jobs through its production and its purchases from other branches. It is important to remember that the number of jobs linked to the automotive industry now excludes temporary workers, since they are now part of services. The number of temporary workers employed – in full time equivalent (FTE) – averaged around 21,000 people between 2011 and 2015. Also, further to the change in nomenclature (see pages 88 and 89), staff from automotive equipment manufacturers included those coming from manufacturers of vehicle seats and electrical materials for engines and vehicles, which previously figured in manufacturing and energy industries' purchases. Vehicle use accounted for 530,000 jobs connected

in particular to services linked to vehicles (sales, repair, automobile equipment centres, rental, etc.), fuel and recycling (oils, demolishers, etc.). These figures include employees, but also individual entrepreneurs (or non-salaried employees).

Finally, road transport (passenger and merchandise) and the associated infrastructure employed nearly 1.2 million people. As for transport activities, which affect for-hire and own-account transport, they have recovered pre-crisis momentum and the volume of jobs has increased significantly in 2017. On the infrastructure side, budget constraints of public authorities, which have reduced their road expenditures by 25% for three years, have impacted activity and employment.

According to INSEE data, on December 31, 2015, Ile-de-France accounted for 21% of jobs in the automotive industry (automakers, equipment manufacturers and body builders). The other leading automotive industry regions were Grand Est (15%), Hauts-de-France (14%), Bourgogne-Franche-Comté and Auvergne-Rhône-Alpes (11% each), Normandie (9%) and Pays de la Loire (6 %).

(1) For the scope of the new EU member states, see page 77.

(2) EFTA (European Free Trade Association): Iceland (included since 2015) + Norway + Switzerland.

(3) Not including Bulgaria in 2005. In 2006, 135,500 light commercial vehicles, of which no French brand, are included in passenger cars in Spain.

Automobile manufacturers include the following brands:

PSA group = Peugeot + Citroën + DS + Opel/Vauxhall (since August 1, 2017).

Renault group = Renault + Dacia/Lada (since January 1, 2017).

Fiat Chrysler Automobiles = Alfa Romeo + Fiat + Iveco + Lancia + Maseratti + Ferrari + Chrysler + Jeep + Dodge.

Ford group = Ford Europe + Ford USA + others Ford.

General Motors = Opel/Vauxhall (until July 31, 2017) + GM Daewoo+ Chevrolet + Pontiac + others.

Volkswagen group = Volkswagen + Audi + Porsche + Seat + Skoda + Bentley + Lamborghini + Bugatti + MAN + Scania.

Daimler = Mercedes-Benz + Smart + FUSO + others.

BMW group = BMW + Mini + Rolls-Royce.

Other Japanese brands: Mazda, Mitsubishi, Subaru, Suzuki, etc.

Tata group = Jaguar + Land-Rover + Tata.

The scope of the groups reflects their situation as at 01/01/2018.

Source: CCFA

(1) In 1999, Renault took control of Dacia, and then in September 2000, of Samsung Motors. The Renault Trafic II was manufactured by IBC, a UK-based subsidiary of General Motors and by Nissan in Spain (until 2014). Since 2006, some of its production has been accounted for in private cars.

(2) Between 1990 and 2000, Mack was integrated in Renault VI. In 2001, the heavy trucks activity of Renault was combined with that of AB Volvo. Renault VI was renamed Renault Trucks.

(3) On January 1, 1999, Renault VI (Renault Trucks) sold its coach and bus business to Irisbus, part of Iveco.

(4) Excluding double counts (see page 84).

## DELIVERIES BY FRENCH MANUFACTURERS OUTSIDE FRANCE

Since 2005, Dacia's exports are included in the scope of consolidation. It is the case as well for Renault Traffic's exports since 2006, and Renault Samsung Motors' in 2007 (180,973 passenger cars). Also certain exports are sent to regions and not specific countries. Lada is included in Renault group since January 1, 2017; Opel is included in PSA group since August 1, 2017.

(1) Since 2004, exports to Cyprus are included in Europe, rather than Asia.

(2) European Union: 15 countries between 1995 and 2003; 25 countries between 2004 and 2005; 27 countries from 2006 to 2012; 28 countries since 2013.

(3) CEEC/CIS, excluding the 10 new countries that joined the European Union in 2004 and 2005, the 12 new countries that joined the European Union from 2006 to 2012 and the 13 that joined in 2013.

# PHYSICAL AND FINANCIAL DATA FROM THE AUTOMOTIVE MANUFACTURING INDUSTRY

Physical and financial data derive from annual enterprise surveys (EAE) on the automotive sector. Since 2008, they have been replaced by the ESANE information system, which combines administrative data and surveys.

These statistics are one of the main sources of our understanding of French industry. SESSI, previously the Secretary of State for Industry's statistics department and now attached to INSEE, uses those figures.

The data reflects the activity of companies with French and foreign capital, located in France, and whose main activity can extend outside France.

The lifespan of companies (creation, reorganisation, acquisition, sale) can feature major variations from one year to the next.

The introduction of a new economic nomenclature, taking into account data both from surveys and administrative data (and in particular, cross-referencing both), and new rules governing statistics (ordering parties, etc.) are the reason behind a slight reduction in the scope of the sector between 2007 and 2008.

From 2016, INSEE was basing its work on the notion of 'enterprise' defined by decree 2008-1354 in application of the 'modernisation of

the economy' law (LME) which is based on the notion of groups of companies (rather than legal units), so as to better take into account the new economic realities that have arisen through globalisation. Data for 2012 and 2013 (below) come from this new source. Trends between the old and new scopes are minor for the moment.

(1) CCFA estimates based on industry data and INSEE

(2) Until 2007, these are actual employees: average employee numbers, corrected by the balance of employees hired (temporary staff) and quoted as hired staff.

## PHYSICAL AND FINANCIAL DATA FROM THE AUTOMOTIVE EQUIPMENT INDUSTRY

The physical and financial data in the table below are taken from surveys (EAE reports) conducted every year of French companies in the automotive equipment manufacturing industry and from 2008, from the new ESANE information system. The trends witnessed since 2016 are described on the opposite page, featuring some changes to the presentation of the data. For example, headcount on December 31, 2013 was 80,416 using the previous scope, and 86,624 with the new one.

In 1993, a new French business category (NAF1), standardized throughout the European Union, was put in place. A number of companies

were reclassified in the metalworking, electrical equipment and car seating industries, resulting in a statistical break in data.

Since 2008, this category has become NAF2, still standardised throughout the European Union: OEM companies, electrical equipment manufacturers for engines and vehicles and car seat manufacturers are now included in this category.

Companies listed in the new "automotive equipment manufacturing" sector do not represent, therefore, all suppliers of the

automotive industry. Added to these should be manufacturers of glass, tires, doors and locks and automotive springs...

In addition to these activities, the automotive manufacturing and automotive equipment manufacturing industries purchase a number of intermediate products (metals, rubber, plastics, etc.), services (consulting, research, advertising, etc.) and capital goods.

<b>Automotive taxes and duties (including VAT)</b>	<b>50,438</b>	<b>55,071</b>	<b>57,401</b>	<b>61,555</b>	<b>61,823</b>	<b>63,244</b>	<b>64,658</b>	<b>-</b>
of which specific automotive taxation	-	37,200	37,300	37,800	37,600	40,800	42,900	-
of which tax on fuels: TICPE and VAT on TICPE	-	28,900	28,200	28,400	28,200	31,500	33,491	35,477
<b>ADDITIONAL INFORMATION (in € million)</b>								
Freeway tolls (excl. VAT)	4,457	6,410	8,110	8,780	9,120	9,390	9,830	10,170
Freeway tolls (incl. VAT)	5,330	7,666	9,700	10,501	10,944	11,268	11,796	12,204
<b>Total expense by the APUs (2) for the road</b>	<b>-</b>	<b>15,800</b>	<b>17,200</b>	<b>18,100</b>	<b>16,300</b>	<b>15,100</b>	<b>13,300</b>	<b>-</b>

(1) According to agrofuels rate.

(2) APU: Public agencies: the entire transportation expenditure (all modes) is equal to the everyday expenditure and the capital expenditure; the figure shown may include dual accounts and it is thus a plus.

(3) Estimation.
