2020, 2021, 2022 and Ongoing Crises
Bad weather is still very much a reality for the automotive industry. With as many disruptions in 2021 as in 2020, we were unable to publish our Analysis and Statistics brochure in time. Considerable data was published late, with world events leading to new deadlines.

2022 has begun with the war in Ukraine. We hope the new crisis will resolve quickly and that Europe will soon be at peace again. We also hope to see 2022 celebrate the end of Covid-19 (though the epidemic has flared up again in China) and of the semiconductor shortage, so the economy can finally recover.

In 2020, global automotive markets contracted for 78 million vehicles, a $14 \%$ drop following the $4.5 \% 2019$ setback. Compared to 2018, the best year for automobiles in history, the market has dropped by 17.5 million units (-18\%). The impact of the health crisis was particularly critical in Europe (-24\%) and on the American continent (-19\%), whilst Asia resisted better (-8\%) thanks to China $(-2 \%)$, which represents nearly a third of the global market.

French groups that are solidly implanted in Europe (27\% of the European market for light vehicles markets) were particularly affected by the crisis. Their growing presence in other world territories, including South America, Russia, or India, which was also weakened, was insufficient to mitigate the extent of the decline.

In 2020, French car manufacturers produced 5.3 million light vehicles, amounting to $7 \%$ of the world automobile production.

In 2021, the semiconductor shortage picked up where the Covid-19 crisis had left off. This limited the market's scope of recovery, which only grew by $5 \%$, and is still lagging by $10 \%$ compared to 2019. In Europe, the go-to market for French manufacturers, sales have remained at a stable low level whilst they were progressing more strongly in Asia and America.

The market in France, the largest one for French groups, remains very low, as does the European one.

Car mobility suffered the effects of lockdowns, but quickly recovered in France, as much for people, with $85 \%$ of journeys, as for merchandise, with $86 \%$ of tonnages transported. In 2021, transport fuel consumption progressed, nearing 2019 levels, a testimony to the resilience of this mode of transport.

In this volatile environment, the global sales of French groups remain low. Specific strategies have been deployed to restore the profitability of groups in order to continue investing in the three disruptions.

- Thanks to a larger offer, energy transition is gaining traction as sales of electric vehicles and rechargeable hybrids grow. However, other technologies must also be considered. Hydrogen, for example, will be able to better meet the needs of companies in the future... when prices become accessible.
- Digital transition is highly committed to connectivity, which is imposing itself in nearly every new model. Research on self-driving cars seems less urgent in a more difficult economic context, and given that the capacity of clients likely to buy new features is not yet consolidated.
- The service transition is still emerging, mobilising new projects and research.

With the Covid health crisis, the shortage of electronic components, a significant rise in energy and raw material prices, and the Ukrainian conflict, we remain steeped in a period of major incertitude. Yet manufacturers must continue to invest, not only to satisfy customers and meet regulatory standards (environmental, for instance), but also to prepare for digital and service transitions. Since 2015, total R\&D expenditures in France have progressed by $25 \%$, amounting to nearly 7 billion euros in 2019. Competition is intense within the global automotive industry, but the competitiveness of French manufacturers on their national territory is stable.

Despite efforts by the French government, such as the CICE tax credit, lower manufacturing taxes, and maintaining the R\&D tax credit (CIR), competitiveness continues to lag compared to the European average; further reducing manufacturing taxes is essential.

2020, 2021, 2022... One crisis after another, French car manufacturers are continually adapting in order to hold their own on passenger car, light commercial vehicle, and industrial vehicle markets. They are unfailingly producing, restructuring, innovating, and investing. But in France, public authorities must keep on encouraging a healthy competitive environment for its industry and considering automotive ecosystem capacities within the framework of the ecological transition. In the wake of three years of crisis, car manufacturers remain competitive and stand ready for new impetus as soon as there is an upturn.

Enjoy the read!
Thierry COGNET

## THE FRENCH AUTOMOBILE MANUFACTURERS' ASSOCIATION

The professional representation of the Automobile began in 1898 with the creation of the Chambre Syndicale de I'Automobile-CSA. In 1909, automobile manufacturers became independent and founded the Chambre Syndicale des Constructeurs d'Automobiles-CSCA, which was replaced in 1991 by the Comité des Constructeurs Français d'Automobiles-CCFA. Currently, its members are: Alpine, PSA (Automobiles Citroën - Automobiles Peugeot), Renault and Renault Trucks. Its purpose is to study and defend the economic and industrial interests of all French manufacturers nationally and internationally (excluding social issues which are dealt with by the Union des Industries et des Métiers de la Métallurgie - UIMM). It has a subsidiary, AAA DATA, which purpose is to provide solutions to its customers thanks to its presence throughout the Data value chain, particularly automotive.

In 2021, the CCFA will directly carry out its study missions (economy, statistics and transport) and rely mainly on the Plateforme Filière Automobile et Mobilités - PFA for communication and lobbying.

Other branches of the industrial automobile sector, also members of the PFA, are grouped together within other federations (FIEV, Fédération des Industries des Équipements pour Véhicules - French Automotive Equipment Industries Association, FFC, Fédération Française de Carrosserie, Industries et Services - French Bodybuilding, FIM, Fédération des Industries Mécaniques - Mechanical Industry Federation, GPA, Groupement Plasturgie Automobile Automotive Plastics Group, SNCP, Syndicat National du Caoutchouc et des Polymères - National Union of Polymers and Rubber Industries).

In 2009, during the crisis, French automobile manufacturers and their suppliers established the

PFA, Automotive Industry and Mobilities, which has the task of contributing to reinforcing the French automotive sector. In 2012, the Automotive Technical Committee (CTA - Comité Technique Automobile) with its two boards, the Automotive Technical Standardisation Council (CSTA - Conseil de Standardisation Technique Automobile) and the Automotive Research Council (CRA - Conseil de Recherche Automobile), which role is to guide research and development, were created. At the end of 2017, in the context of energy, digital and service transitions, the PFA entered a new stage with the following missions: leading the innovation dynamic, competitiveness initiatives right through the sector, planning ahead for employment and skill requirements, expressing joint positions for the sector, coordination and organisation of professional shows and communications throughout the sector.

Foreign brands are represented by the International Association of the Automobile and the Motorcycle (CSIAM - Chambre Syndicale Internationale de l'Automobile et du Motocycle). The downstream of the automotive sector is represented by the National Council of Automotive Professions (CNPA) which brings together trades in vehicle sales, fuel distribution, repair, recycling and automotive services.

CCFA is associated with Brussels-based ACEA (Association des Constructeurs Européens d'Automobiles), the European Automobile Manufacturers' Association.
CCFA is also a member of the International Organisation of Motor Véhicle Manufacturers (OICA - Organisation Internationale des Constructeurs de l'Automobile), which brings together national associations representing the sector from around the world.

# THE HEALTH CRISIS HAS CAUSED A COLLLAPSE OF GLOBAL AUTOMOTIVE MARKETS 

European markets, which had dropped and were at very low levels during the 2009 crisis, began recovering in 2014. Along with a broader scope, the recovery allowed French groups to gain market shares in Europe until 2018. In 2020, the health crisis recession caused a collapse of automotive markets in Western Europe (-24\%) on a greater
scale than the two previous crises. In this context, French groups have slightly increased their market share in France (58.8\%), but it decreased by a percentage point of 1.5 in Europe, excluding France (20.7\%).

Outside Europe, Asian markets have weathered
the crisis better, particularly thanks to China's resistance ( $-1.9 \%$ ), with only a small impact on French group deliveries, which dropped by 24\% for Asia and by $25 \%$ overall. Global light vehicle production of French car manufacturers has decreased by $28 \%$.

*On 01/17/2021, the PSA group and the FCA group merge to create Stellantis group.

In 2020, the health crisis caused an unprecedented global economic crisis, with a decline in GDP (Gross Domestic Product) of more than 3\%. With Turkey, China is one of the rare countries to have experienced positive growth in 2020 (+2.3\%). In this context, the global production of French groups has receded by $28 \%$ for private vehicles and by $23 \%$ for light commercial vehicles. The collapse is to be compared with that of global markets, which dropped respectively by $15.9 \%$ and $8.7 \%$. Consequently, total sales of French carmakers dropped by $20 \%$ in 2020, along with their investments, albeit to a lesser extent to better meet the numerous automotive sector challenges, such as the competitiveness of industrial resources, market and production globalisation, preserving the environmental sustainability, and
the growth of digital technology and new mobility services.

In France, economic activity receded by 8\% in 2020, while the automotive market dropped by $25 \%$ for private vehicles and by $16 \%$ for light commercial vehicles. Due to travel restrictions, road traffic also collapsed (-17\%). Lockdown measures and shop closures caused household car expenditures to drop by more than $7 \%$, despite a greater purchasing power. The share of French car manufacturers on the light vehicle market has reached $58.8 \%$ (+0.3 point), alongside a higher share for electrified vehicles (both electric and plug-in hybrid).

# FRENCH GROUPS, REPRESENTING 27\% OF THE EUROPEAN MARKET FOR LIGHT MARKETS, ARE SUFFERING FROM THE SALES DECREASE IN EUROPE 

The share of French groups in global vehicle production dropped to $7 \%$ in 2020, down one percentage point compared to 2019.

*On 01/17/2021, the PSA group and the FCA group merge to create Stellantis group.

In 2020, in Western Europe, markets for new vehicles receded by $25 \%$, whilst the market share of French groups dropped by 1.1 point, following an increase in 2018 due to the integration of new brands. The weight of European sales amongst French group sales will not continue in the long term, due to differences in automobile density between a mature territory and emerging countries.

In Eastern Europe, markets collapsed just as drastically as in the rest of Europe (-23\%). However, starting from a lower level following the 2019 sales drop, the Russian market only dropped by $9 \%$ in 2020 . Indeed, French groups have gained market shares here. Likewise, the Turkish automotive market is one of the rare ones to have experienced a growth in 2020. It bounced back following two years of drastic dips in registrations, leading to French car manufacturers also gaining market shares in this country.

The Chinese market weight and its rate of change explain evolutions in the general Asian market.

Here, the decline in registrations was contained thanks to an earlier economic upturn compared to the rest of the world. Following continued growth since 2013, Asian opportunities for French groups have been divided by three since 2018, including due to deliveries to Iran halting, as well as the severe drop in exports to China, where strategies have been readjusted.

In Latin America, markets regressed by $27 \%$ in 2020, and up to $57 \%$ in Columbia. Sales of French carmakers to this area dropped by nearly $40 \%$, except in Argentina, where deliveries only dropped by $10 \%$.

Finally, Africa was also severely affected by the economic crisis, with registrations declining by 22\%, except in Egypt, where the market has bounced back. In this context, opportunities for French groups have receded by $40 \%$. In Egypt and Morocco, they have nonetheless slightly increased their market shares.

In emerging countries, where opportunities should
grow over time, French groups are continuing to expand both commercially and industrially, with or without partnerships, to meet motorisation needs. This involves continued efforts in Asia, South America, and various African countries.

10\% Weight of the
automohile in the
foreign trade of goods

## WORLD VEHICLE PRODUCTION

In 2020, global vehicle production was hit hard by plant closures and declining sales linked to containment measures following the health crisis. The number of vehicles produced worldwide fell by $16 \%$ to 77.7 million, or 14.5 million less than in 2019. Production was down $22 \%$ in Europe and America, 10\% in Asia and 28\% in Africa.

After the drop in 2009, world production grew continuously until 2017 (+3\% per year), to peak at 97 million units. Then, in 2018, it experienced a first decline which was confirmed in 2019. In 2020, the sharp drop in production brings it back to its level of 2010. Automotive demand is characterised by the scale of its fluctuations even at the global
level and, in 3 years, the cumulative decline since the record level of 2017 reaches $-20 \%$, or -20 million units.

In mature areas (Western Europe, North America, Korea, Japan), the production levels observed in 2020 are now all lower than their pre-crisis levels (2007). However, in emerging areas or countries and particularly in Asia, which is the current centre of automotive expansion, production remains higher than before the crisis. China, which has held up much better than the other countries and is experiencing a decline in production of only $2 \%$ in 2020, has multiplied its volumes by nearly 3 since 2007.

* Only passenger cars

Sources: OICA - CCFA estimates March 2021

In Europe, production fell by $21.5 \%$ in 2020, standing at 17 million vehicles, or $22 \%$ of the total. The drop is more marked in Western Europe where production volumes fell by $25 \%$ in 2020, with significant drops in major countries: Germany (-24\%), Spain (-20\%), Italy (-15\%), United Kingdom (-29\%). France is the most affected country with a $39.5 \%$ decline in its production, which is also explained by the departure of production of lower-range cars, due to its lack of competitiveness. In Central and Eastern Europe
including Turkey, production fell by $15 \%$. It fell by $18 \%$ in the new member states of the European Union, by $17 \%$ in Russia and by $11 \%$ in Turkey.

On the American continent, production represented 15.7 million vehicles in 2020 ( $20 \%$ of the total), down $22 \%$ compared to 2019. South America experienced a more marked drop ( $-30 \%$ ) than the America, where production fell by $20 \%$, including -19\% in the United States.

Asia-Oceania, which accounts for more than half of world production, is holding up better than the other regions (-10\%), mainly thanks to China, which recorded a drop of only $2 \%$. In India, production collapsed by $25 \%$ while in Japan and Korea, it fell by $16.7 \%$ and $11.2 \%$ respectively.

## WORLD VEHICLE PRODUCTION

Between 2010 and 2018, the automotive industry remained globally dynamic overall. Vehicle production increased by $25 \%$, or 19 million units. Only South America and South Korea were exceptions with declining production over the same period. But, in 2019, we are witnessing a first decline in world production (-5.3\%) due to the international context marked by political and economic uncertainties which weigh on trade and growth. Then, the year 2020, marked by the health crisis, led to a collapse in production (-16\%) which returned to its 2010 level, i.e. 78 million vehicles. However, there are contrasting developments between mature areas or countries and emerging areas or countries.

In mature areas or countries, production increased by nearly 5.5 million vehicles between 2010 and 2018, reaching a level of 45.5 million units. However, in 2019, it fell by $3.7 \%$, then by $20 \%$ in 2020, losing nearly 9 million vehicles in two years. Thus, over the entire 2010-2020 period, the area lost nearly 5 million vehicles and now represents only $45 \%$ of global production, compared to $48 \%$ in 2019 and $52 \%$ in 2010. During the period, only North America saw its production increase (+10\%), in particular thanks to Mexico (+36\%). With production falling by $25 \%$ in 2020 , Western Europe is the region that has suffered the greatest decline over the entire period 2010-2020 (-26\%) while production in Japan and South Korea fell by $16 \%$ and $18 \%$ respectively.

In emerging areas or countries, production increased by 13.5 million vehicles between 2010 and 2018 ( $+38 \%$ ) and fell by 8 million units between 2018 and 2020 (-17\%). This represents a gain over the period 2010-2020 of nearly 5 million units produced and increases the share of this zone in world production ( $52 \%$ of the total). Within this group, China, Central and Eastern Europe and Turkey are the areas in which production remains above its 2010 level in 2020. China experienced the strongest increase between 2010 and 2018 ( +9.5 million vehicles) but has lost 2.6 million units since 2018. In 2020, it represents $32 \%$ of global production, compared to $24 \%$ in 2010 . Central and Eastern European countries and Turkey have also increased sharply between 2010 and 2018 (+1.9 million units) but stagnated in 2019 and fell by $15 \%$ in 2020 . They represent $9 \%$ of
world production. Indian production increased by more than $30 \%$ over the same period ( +1.6 million units and a share of $5 \%$ ) but fell by $34 \%$ between 2018 and 2020. Finally, production in ASEAN countries gained 1.2 million units between 2010 and 2018 but lost 1.5 million between 2018 and 2020. South America is the only emerging zone which saw its production drop over both periods. It only represents $3 \%$ of world production, compared to $5 \%$ in 2010.

 WORLD MARKETS OF FRENCH GROUPS: EVOLUTION COMPARED WITH 1997

## In thousands of units

3,500

[^1]due to market difficulties in China and Iran. They are also down in Latin America (-96,000 units). Deliveries are up in Central and Eastern European countries and in Turkey ( $+355,000$ units) and in Africa (+53,000 units). In Europe, deliveries to Spain and Italy continued to grow (respectively $+172,000$ and $+204,000$ units since 2010), after the fall due to the crisis. In 2020, we are witnessing a collapse in deliveries to all zones, except the PECO/CIS zone, Turkey, due to the rebound of the Turkish market and the nearly $80 \%$ increase in deliveries to this country.

> Share of emerging zones and countries in global vehicle production

## THE WORID RANKING OF CAR MANUFACTURERS

The top 10 manufacturers accounted for $67 \%$ of global production in 2020. French manufacturers Renault and PSA produced just over 5 million vehicles between them and rank tenth and twelfth in the world respectively. In order to strengthen their competitiveness, manufacturers are multiplying cooperation in different forms. French manufacturers are part of this approach. On the one hand, Renault relies on its alliance with Nissan, which has been extended to Mitsubishi; together they produced more than 7 million vehicles in 2020. On the other, PSA merged in 2021 with FCA to create Stellantis, which would have represented nearly 6 million vehicles in 2020 .

In 2020, global production fell by $16 \%$, but in Europe the drop reached $21 \%$ and particularly impacted European manufacturers. Thus, the production of vehicles by French manufacturers
has been particularly affected by the health crisis and the collapse of European markets. Their production represented $7 \%$ of world production and that of passenger cars $8 \%$, a level that remains higher than that observed in 2013-2014 (6\%).

Car manufacturers have become strongly internationalised since 2000 and continue to develop their industrial sites outside their origin area. European, American, Japanese and Korean manufacturers produced between 60 and $70 \%$ in their area in 2000; currently the ratio oscillates between 30 and 50\%. Japanese manufacturers are the most internationalised (they only made a third of their production in Japan), followed by Korean manufacturers ( $44 \%$ in Korea). Even manufacturers in emerging countries, such as Geely or Tata, carry out a very large part of their production outside their origin country (respectively

31 and $57 \%$ in 2017). The various cooperations between manufacturers are accelerating this phenomenon of internationalisation.

Note: The production of Chinese manufacturers does not include joint-ventures.
(1) The vehicles include passenger cars, light commercial vehicles, heavy trucks, and coaches and buses. There may be double counts between manufacturers.
(2) The output of GM and Ford include their activities in China.

Sources: OICA, annual reports, CCFA estimates July 2021

The decline in global production in 2020 has had an impact on all major automotive groups. Those most established in Europe and America seem to have suffered the most from the decline in the markets.

Thus, the Toyota group took first place in the ranking in 2020, overtaking the Volkswagen group, thanks to a production which fell slightly less than the latter (-14\% against -18\% for Volkswagen).

General Motors, already impacted by the evolution of its perimeter, now without Opel, fell further, moving to fourth position. Ford's production is, for its part, strongly affected by the decline in North America and falls to sixth place.

Japanese manufacturers are, for their part, less affected by the health crisis. Hyundai-Kia saw its production fall by $12 \%$, which allowed it to move up to third place, while Honda passed Ford in fifth place in the ranking. Suzuki is also moving up the rankings, while Nissan, despite a sharp drop in production, is not moving.

As for European groups, the Volkswagen group, which is very present in emerging countries, particularly in China, held up better than its European counterparts and fell by «only» $18 \%$. Similarly, Daimler and BMW managed to limit the fall in their production to $-14 \%$ and $-9 \%$. For the other European groups, the situation is very degraded with production cuts of around $25 \%$.

Manufacturers in emerging countries (China, India) are experiencing very contrasting situations. The Indian manufacturer Tata was particularly affected by the decline in the Indian market ( $-25 \%$ ) and saw its production drop by $25 \%$. Chinese manufacturers, on the other hand, benefited from the better resistance of the markets in China. Changan, Great Wall or BAIC even manage to maintain an increase in production in 2020.

For heavy vehicle manufacturers, the global economic situation has also had a strong impact on their activity and the Volvo group (including Renault Trucks) has reduced its production by $29 \%$ in 2020.

# TRENDS IN PRODUCTION AND TRADE AMONG THE WORLD'S LEADING AUTOMOTIIE REEIONS 

China, which has become the world's leading producer since 2010, produces mainly to satisfy its domestic market: imports and exports, with volumes around one million units in recent years, each represent $4 \%$ of the production.

The European Union ( 28 countries) is the second largest producing area in the world, thanks to its internal market and the weight of its exports (one third of production).
intended for the local market and exports represent only $13 \%$ of production. Imports, on the other hand, amount to 30\% of production.

In Japan, exports represent approximately 50\% of production, except in 2020 when their weight drops to $36 \%$. As for imports, they still account for around $6 \%$ of total registrations.

In North America, including Mexico, production has declined since 2000 but remains at a high level. It is

Since 2000, the evolution of the automotive industry has been contrasted in the three major automotive areas.

In the European Union (28 countries), vehicle production grew by $9 \%$ between 2000 and 2018 (compared to around $15 \%$ between 2000 and 2007) and trade, already significant, has increased very markedly. In 2019 and 2020, despite declines in production of $5 \%$ and $23 \%$ respectively, vehicle exports only fell by $2 \%$ and $14 \%$.

In North America, production fell by 6\% between

2000 and 2019. Imports, already very significant in 2000, grew by $67 \%$ between 2000 and 2018 and represent more than a third of production, both for passenger cars and for commercial vehicles. As for exports, in 2018 they represented only $13 \%$ of production (one third for the EU and half for Japan), with a very significant weight for passenger cars ( $31 \%$, against $3 \%$ for commercial vehicles ).

In Japan, vehicle production fell by 5\% between 2000 and 2019, but is higher than its 2010-2018 average, following the dynamism of the domestic market and exports. The latter had increased significantly, in
connection with the depreciation of the yen, and in 2008 exceeded the level of 2000 by $51 \%$; in 2020 , production only fell by $17 \%$ thanks to the better performance of the domestic market, while exports fell by $39 \%$.

In China, production increased by 41\% between 2010 and 2019, and exports by 108\%, but the latter only represent a small volume. In 2020, Chinese production only fell by $2 \%$ and exports by $7 \%$.

## WORLD VEHICLE MARKETS

In 2020, the global automotive market experienced an unprecedented fall of $14 \%$, bringing the volume of registrations back to their 2010 level, i.e. 78 million vehicles. The passenger car market suffered more from the crisis than the commercial vehicle market ( $-16 \%$ against $-9 \%$ ). The decline in sales was more marked in Europe (-20\%) and America (-18.5\%), while Asia held up better thanks, in particular, to the lesser decline observed in China (-1.9\%) which represents two-thirds of the Asian market. Africa, which represents only $1 \%$ of the market, suffered a sharp decline. We also see that the least developed countries, where the support mechanisms have been less, have suffered more from the crisis with market declines of more than $20 \%$.

In Europe, the decline in sales is less marked in the Central and Eastern European markets, in particular because the Russian and Turkish markets, which fell in 2019, started from a lower level. In America, NAFTA countries show a less steep drop (-16.6\%)
than Central and South American countries (-27\%). In Asia, India and Japan were more affected by the crisis than China and South Korea, with a drop in registrations of $-23 \%$ and $-11.5 \%$ respectively.

The automotive markets are strongly linked to the economic situation and cyclical phenomena mainly explain their evolutions. However, they are also characterised by short-term fluctuations of significant magnitude, whether for renewal or first equipment.

Since 2005, the centre of gravity of the global automotive market has shifted from Western Europe and North America, mature markets ( $56 \%$ of the global market in 2005, against $38 \%$ in 2020) to Asia. Over this period, the Western European market stagnated, before collapsing in 2020, and only represents $16 \%$ of the total, against $26 \%$ in 2005. NAFTA, which weighed $31 \%$ of the world market in 2005, in today represents $22 \%$. Over the same period, the Asian region experienced triple-digit growth, thanks in
particular to the strong increase of sales in China and India, and now represents more than $51 \%$ of worldwide sales (compared to $31 \%$ in 2005).

China, which became the world's largest market in 2009, now accounts for $32.5 \%$ of the total, followed by the United States (18.5\%), Japan (5.9\%), Germany ( $4.2 \%$ ) and India ( $3.8 \%$ ). The top five world markets thus represent $65 \%$ of the world market.

Global automotive sales were heavily impacted by the 2020 health and economic crisis and fell 14\%. The Chinese market, which had been in decline for two years, is one of those that has best resisted the pandemic; it fell by only $1.9 \%$, to just over 25 million vehicles.

In the United States, the market recorded a drop of $15.2 \%$, to 14.5 million vehicles, i.e. a volume which remains higher than that observed during the 2009 crisis (10.6 million). In Canada, the decline was more pronounced with a $21 \%$ drop in registrations. Finally, in Mexico, the market fell by $28 \%$. In Central and South America, the Brazilian market, which had been recovering for a few years, collapsed by $26 \%$, losing 800,000 vehicles to reach 2 million units in 2020. In other countries, declines range from 18\% in Argentina to 57\% in Colombia.

In Western Europe, the market, down 24\% in 2020, now stands at 12.7 million vehicles, i.e. a lower level than the trough of 2013 ( 13.2 million). Despite the sharp declines observed on the Italian (-26\%) and Spanish ( $-31 \%$ ) markets, registered volumes remain
above the low points recorded in 2012-2013. On the other hand, in France and the United Kingdom, where the declines were also marked ( $-24 \%$ and $-28 \%)$, volumes fell below their lowest level in 2013. As for Germany, down by $18 \%$, it returned to a volume identical to 2013 with 3.2 million vehicles.

Central and Eastern Europe, which accounts for $5.1 \%$ of the global market, saw its automotive market shrink by $6.5 \%$ in 2020. New member states of the European Union experienced negative growth rates similar to other members of the Union, i.e. around $-20 \%$. On the other hand, the Russian market, starting from a low level in 2019, fell less (-8\%) to 1.6 million vehicles. Turkey, after two years of crisis, saw its vehicle sales jump by $66 \%$.

In the Asia-Oceania zone, the market excluding China amounted to 15 million vehicles in 2020, or $19 \%$ of the total. The Japanese market reached 4.6 million vehicles, down 11.5\% in 2020. The Indian market totaled 2.9 million vehicles in 2020, down $25 \%$ compared to 2019, in an already declining market last year (-13\% compared to 2018). Indonesia
is the country that has seen the sharpest decline, going from more than one million vehicle registrations in 2019 to 500,000 vehicles in 2020 . Conversely, in South Korea, the market which was down in 2019 $(-1.8 \%)$ grew by $6.2 \%$ in 2020 and reached 1.9 million vehicles.

In Africa, registrations fell by $22.6 \%$ in 2020 and fell below one million vehicles to represent only $1.2 \%$ of the world market. South Africa, Africa's leading market, saw its registrations drop by 30\% in 2020 to 377,000 vehicles. In Morocco, the market fell by $20 \%$ to 133,000 units. Only Egypt, the second African market, is experiencing a rebound in 2020 with a 29\% growth in registrations.

## VEHICLES IN USE IN THE WORLD

In 2015, the global vehicle fleet (passenger cars and commercial vehicles) amounted to 1.3 billion units (nearly $75 \%$ passenger cars), an increase of $4 \%$ compared to the previous year. The average growth rate since 2011 is $4 \%$, a more dynamic pace than during the crisis (+3\% on average between 2007 and 2009). In 2015, registrations represented $7 \%$ of the fleet and ensure both the renewal of the existing fleet and its pure growth. In 2020, with a collapse in sales and a larger base, this ratio will drop significantly, which should result in a slower rate of growth of the base.

Bases are almost stable in the mature markets of developed countries (increases generally between $0 \%$ and $2 \%$ ). They are growing strongly in emerging countries (between 3\% and 12\%).

Source: OICA

The United States fleet is the largest in the world with 264 million vehicles, ahead of those in China and Japan (respectively 163 and 77 million units). France ranks eighth in the world.

The car density in the world averaged 182 vehicles per 1000 inhabitants (+27\% compared to 2005). Nevertheless, it varies from 42 vehicles in Africa to 670 in the NAFTA zone (United States, Canada, Mexico), passing through 85 in Asia (excluding Japan and South Korea), 176 for Central and South America and to more than 500 for the European Union and Japan/South Korea. The density of Europe as a whole stands at 471.

North Africa (Algeria, Egypt, Libya, Morocco and Tunisia), which is close to Europe, has benefited
from strong growth in the base with an average rate of $6 \%$ per year since 2005. The latter is thus increased from 10 to 19 million units.

VEHICLE DENSITY BY REGION
(NUMBER OF VEHICLES PER $\mathbf{1 , 0 0 0}$ INHABITANTS)

In 2015, mature areas represented more than 50\% of the world stock and $15 \%$ of the world population. They have lost around 15 points to the benefit of emerging zones since 2005.

Within the Europe zone, which represents about a third of the global stock, the number of vehicles in use is growing more rapidly in the east than in the west (see page 19). Motorisation rates are also mixed. The number of vehicles in the fleet in this zone increased by nearly 65 million units compared to 2005, of which $73 \%$ outside Western Europe (+20 million additional units in Russia).

In the Americas, NAFTA ( $25 \%$ of the global fleet) is a mature market with a high car ownership rate, especially in the United States where it stands at 821. Mexico is experiencing the highest growth in the fleet (+4\% between 2010 and 2015). On the other hand, Central and South America is an emerging zone whose share reached $7 \%$ of the world fleet in 2015. Its density stood at 176. The number of vehicles in America has increased by 86 million units since 2005, almost equally between NAFTA and Central and South America.

In Asia, Japan and South Korea (8\% of the global fleet), mature markets, have a motorisation rate of 609 and 417 respectively. On the other hand, emerging countries, with a larger population, have a low car density: 22 in India, 87 in Indonesia and 118 in China. Since 2005, almost all of the increase in the number of customers has come from Asia - excluding Japan and South Korea. China ( 131 million additional units) is far ahead of India (+19 million) and Indonesia (+13 million).

## WORLD TRADE IN AUTOMOTIUE PRODUCTS

In 2019, even before the pandemic, global merchandise trade contracted for the first time since the 2009 crisis. Trade was held back by political tensions and protectionist measures as well as weaker global GDP growth, weaker than in 2018. Global exports of automotive products fell by $2.7 \%$ to $\$ 1.502$ billion, representing $8 \%$ of global merchandise exports and $12 \%$ of manufactured goods exports.

In addition to the macro-economic context, world trade in automotive products is influenced by multilateral agreements under the aegis of the WTO but also, increasingly, by bilateral or regional agreements signed between areas. In 2017, faced with high-level markets in the European Union and NAFTA, the share of intraregional trade in world trade was around $75 \%$. The renegotiation of the free trade agreement between Mexico, the United States and Canada (CUSMA), which replaces

NAFTA on July 1, 2020, will further strengthen intraregional trade in this area. Conversely, in Asia-Oceania, intraregional trade barely reaches $30 \%$. This area remains very outward-oriented with national markets that are not as open (Japan, etc.).

Finally, world trade is also influenced by changes in exchange rates. In 2019, the euro depreciated against the dollar due to the slowdown in economic activity in the euro zone. The dollar, meanwhile, appreciated against all currencies due to trade and geopolitical tensions, except with the yen.

In 2019, the European Union remains the main exporter of automotive products with 752 billion dollars, or $50 \%$ of world exports. The other major exporters are Japan (\$152 billion), the United States (\$139 billion) and Mexico (\$124 billion). South Korea and Canada are also among the top exporters of automotive products ( $\$ 60$ billion
in 2019). Chinese exports have been growing in recent years but are at a lower level (59 billion dollars). In 2019, only the NAFTA countries and South Korea saw an increase in their exports.

On the import side, the European Union 28 countries imported 642 billion automotive products in $2019,82 \%$ of which came from its area.

Automotive balances are positive in Japan (+129 billion dollars), in the European Union and in particular in Germany (+110 billion dollars), Mexico (+74 billion dollars) and South Korea (+49 billion of dollars). On the other hand, they are in deficit, at a record level in the United States (-178 billion dollars) and in China ( -21 billion dollars).

## 4\%

Share of France in world exports of automotive industry protucts in 2019
(1) For the comparisons, 15 EU countries have been included since 1993, 25 since 2004, 27 since 2006 and 28 since 2014.

Between 2005 and 2018, trade balances in automotive industry products evolved in contrasting ways depending on the country or zone. Mexico, South Korea, Japan and the European Union saw their trade surpluses increase. Conversely, the deficit balances of the United States, Canada and China increased until 2018. In 2019, the positive balance of the European Union deteriorated sharply ( -40 billion dollars) with the decline in exports in the main countries ( $-8 \%$ in Germany and the United Kingdom, -7\% in France and -5\% in Spain).

In other areas, the trade balance in automotive products, which was positive, has become negative. In Canada, for example, the balance of 9 billion dollars in 2005 became a deficit of 15 billion in 2019, in connection with the place taken by Mexico in trade within NAFTA. Thus, in Mexico, the trade surplus was multiplied by 7 between 2005 and 2019. China, which has become the world's largest automotive market, multiplied its trade deficit by six, from -4 to -21 billion dollars between 2005 and 2019.

In 2019, Germany, with a third of European exports and 16\% of world exports ( $\$ 247$ billion), remains the leading exporter of automotive industry products in the world. In second place, Japan represented 10\% of world exports of automotive products in 2019, with 152 billion euros, of which around 60 billion went to North America. Its exports to China fell to 14 billion dollars, a level close to
those to the EU28 (20 billion). France represented nearly $4 \%$ of world exports of automotive products with 59 billion dollars (including intra-EU trade), compared to nearly $7.6 \%$ in 2004.

Exports from the European Union to 28 countries reached $\$ 752$ billion ( $50 \%$ of world exports of automotive products), including 70\% intra-EU trade in 2019 ( $74 \%$ in 2009). EU exports to China amounted to around $\$ 37$ billion. They reached 10 billion dollars to Russia as well as to Japan, 17 billion to Africa and 13 billion to the Middle East. Based on Eurostat data, more than half of EU exports to non-EU countries come from Germany (51\% in 2019), ahead of the United Kingdom (12\%), Italy (6\%), Spain and France (4\%). The share of the six new entrants (Hungary, Poland, Czech Republic, Romania, Slovakia and Slovenia) amounted to $10 \%$ in 2019.

The United States remained the world's largest importer of automotive products, with \$318 billion; following in particular the high level of its domestic market, its deficit in automotive products is significant and reached 178 billion dollars in 2019. With Canada and Mexico, the zone imports 443 billion dollars of automotive products, of which $40 \%$ comes from the 'outside. But the new CUSMA deal is expected to bolster imports from Mexico amid the U.S. distancing from China and a drive to relocate production nearby.

According to the Mexican Automobile Federation
(AMIA), eight out of ten vehicles manufactured in Mexico are exported, of which $77 \%$ go to the United States. Chinese imports fell by 8\% in 2019 to $\$ 80$ billion, but since 2005 they had grown by $15 \%$ per year. Reflecting the evolution of their oil resources, imports have developed strongly since 2005 in Russia, Saudi Arabia and the United Arab Emirates. In Russia, they increased nearly fourfold between 2005 and 2013, then fell sharply to pick up again in 2017. In 2019, they returned to a level close to that of 2010 ( 25 billion dollars). Finally in Australia, imports have almost doubled since 2005 to reach 25 billion dollars; this country has ceased to have production sites for light vehicles since the end of 2017.

## NEW PASSENGER CAR REEISTRATIONS BY COUNTRY

The passenger car market in Western Europe ( $90 \%$ of the European market) lost 3.5 million units in 2020 ( $-25 \%$ compared to 2019) to fall to 10.8 million registrations, i.e. a level below the low point of 1993 (11.3 million units) and 2013 (11.5 million units).

The main passenger car markets in Western Europe are Germany (which accounts for 27\% of the Western European market), France (15.3\%), which in 2020 overtakes the United Kingdom (15.1\%), followed by Italy (12.8\%) and Spain (7.9\%). In 2020, all these countries experienced a drastic drop in their registrations, ranging from
-19\% in Germany to -32\% in Spain (-25\% in France). For the first three countries (Germany, United Kingdom, France), this decline caused the level of registrations to fall below their low point of 2013. On the other hand, in Italy and Spain, it remains above (+18 \% in Spain, +6\% in Italy). In the other southern European countries (Greece, Portugal), despite markets down $30 \%$ in 2020, the level of registrations remains around $40 \%$ higher than their low point in 2012. In European countries North (Denmark, Finland, Norway, Sweden), less impacted by the first wave of COVID in March 2020, the markets fell less sharply, from only $-0.7 \%$ in Norway to -18\% in Sweden.

As a \% of Western European market

Source: CCFA

The Western European market brings together the markets of 18 countries: the 15 member countries of the European Union before 2004, plus the countries of the European Free Trade Association (EFTA: Switzerland, Norway and Iceland). The United Kingdom, even though it officially left the EU on January 31, 2020, also remains counted in this group. These countries have a close environment and obey comparable economic rules.

The market had experienced two major crises before that of 2020: the first in 1993 (down -16\% or -2.2 million units in 1 year) and the second from the end of 2008. The latter had led to a $22 \%$ fall in the market between 2007 and 2013 (-3.3 million units) with a contrasting impact depending on the geographical area. The group of countries comprising Northern Europe, Germany and the United Kingdom had suffered a drop of only $5 \%$ during the crisis, while it reached more than $50 \%$
for Southern Europe (Spain, Italy, Portugal and Greece). In 2019, the countries of the first group had caught up with their pre-crisis level, while the countries of southern Europe were still below this level. With the 2020 health crisis, the market lost 3.5 million units in one year, a shock of greater magnitude than the two previous crises.

# NEW PASSENGER CAR REGISTRATIONS BY GROUP 

In 2020, the PSA and Renault groups represented $25 \%$ of the Western European market for new passenger cars, down one point from 2019.

The French groups rely on their different brands which are complementary. The Renault group is based on the brands Renault (7\% market share), Alpine and Dacia. The latter, which represented $0.5 \%$ of the market in 2007, grew to reach $3.2 \%$ in 2019; in 2020, it drops slightly to $2.8 \%$. As for the PSA group, it now includes four brands: Peugeot (6.5\%), Citroën (3.9\%), Opel/Vauxhall (4.2\%) and DS (0.4\%). On January 16, 2021, the PSA group
merged with the FCA group to create Stellantis, which brings together the 14 brands from the two entities representing a total of $21 \%$ of the market.

In 2020, foreign groups are mainly represented by the Volkswagen group, which holds a $25 \%$ market share, and by five other large generalist groups (including FCA) and two groups specialising in higher ranges, each with a market share of between $6 \%$ and $7 \%$.

MARKET SHARES OF GROUPS (1) IN WESTERN EUROPE (EU18)

(1) The scope of the groups reflects their situation as at 01/01/2020.
(2) Opel in included in GM group until July 31, 2017 and PSA group since August 1, 2017.
(3) On January 16, 2021, the PSA group merged with the FCA group to create Stellantis.

See page 74 for groups definitions.
Source: CCFA

The market share of the French groups PSA and Renault ( $25 \%$ in total) fell in 2020 but remains above its 2007 level. At the start of the 2000s, it was above $25 \%$ because the French and Southern European markets 45\% of the Western European market. Today, these markets only represent 38\% of the Western European market, but PSA's market share has increased thanks to the integration of Opel on August 1, 2017. In 2020, Opel's market share has lost 1 point to $4.2 \%$, while DS gained 0.1 point of market share and stands at $0.4 \%$.

Since 1995, the Volkswagen group (VW), with its four main brands, has consolidated its positions and in 2020 regained its 2014 level (25\%) after falling between 2014 and 2018.

The Fiat group, including the brands of the Chrysler group, represented 5.9\% of the West European market in 2020, compared to nearly $13 \%$ in 1997. In 2020, the market share of the Fiat brand remains almost stable at $4.1 \%$.

The American group Ford has experienced a similar evolution to that of the Fiat group, halving its market share between the beginning of the 1990 s and today to stand at $5.9 \%$ in 2020.

The German groups Daimler and BMW, specialists in higher ranges and corporate sales, are pursuing a strategy to expand their range and continue to gain market share. Daimler (Mercedes-Benz and smart), which has been growing since 1997 as a result of the diversification of its vehicle range, is stable in 2020 at $6.8 \%$. BMW, including the Mini
brand, also remains stable at $7 \%$.
The market share of the Toyota group, which rose continuously from 1995 (3\%) to 2007 (6\%), then fell back to $4.1 \%$ in 2016 . Since then, the market share has grown again and reached 5.3\% in 2020.

The market share of the Hyundai-Kia group, which was almost non-existent in 1990 ( $0.1 \%$ ), has steadily increased over the past thirty years. Rising from $2.1 \%$ in 2000 to $4.2 \%$ in 2010, its market share gains another 0.3 point, to $6.7 \%$, in 2020.

## RANGE RANKING IN 2020

Respective numbers of models and electric models offered by the French groups

The French groups have enriched their ranges of vehicles by offering more than sixty different models (compared to 27 in 2000). In recent years, they have developed their offer in the different ranges (multipurpose vehicles, 4WD, SUV, sedan) and in the electric vehicle segment with 18 models. They regularly renew existing models (C3, C4, 5008,

Megane, Scenic) or develop new ones (E-C4, Spring). In addition, each body includes different versions depending on the equipment of the car, which implies the marketing of several thousand possible combinations (more than 8,000 for the entire market according to ADEME).

As \% BREAKDOWN OF NEW PASSENGER CAR REGISTRATIONS BY RANGE IN EU-18
of the total market

Source: CCFA

In 2020, the diversity of the offer continues to increase; the market share of the top 15 vehicles sold in Western Europe is only $24 \%$ compared to $40 \%$ in 2000.

The economy and lower ranges dominate the market with $42 \%$ of registrations in 2020, a stable figure since 2014. On the other hand, the lower-mid range, rich in sedans, has lost nearly 5 points of market share since 2014 (to 25\%), in favour of the higher ranges (highmedium, premium and luxury) which gained 4 points and represented $32 \%$ of the market. Differences remain between Northern Europe, which is more focused on upper ranges and station wagons, and Southern Europe, which favours lower and low-mid ranges. Despite the success of the lower range and sedans in Germany and the United Kingdom during the 2009 crisis, the market shares of the lower ranges remain, in these two countries, 5 to 11 points below the European average, while those of the higher ranges remain above (39\%).

The bodies of new cars have also evolved over the past ten years in Western Europe. Sedans now represent $41 \%$ of registrations, compared to $57 \%$ in 2010, while the 4WD and SUV category, which benefits from a varied and growing offer, has gone from $11 \%$ of the market in 2010 to $41 \%$ today.

The technical characteristics of the vehicles (engine, displacement, power) have also undergone changes thanks to the reduction in the size of the engines (downsizing, identical power of the engine with a smaller displacement) and the development of electrification, but remain closely linked to the economical, fiscal and geographical aspects of each national market. Engine displacements and average power are higher in Northern Europe with the exception of Norway where the electric car market is highly developed.

Finally, the 4WD market has grown significantly in Western Europe since 2010 with a market share

- RANKING OF THE 25 LEADING MODELS IN WESTERN EUROPE IN 2020

Source: CCFA
that has doubled in ten years to reach 16\% in 2020. It is higher than average in Nordic and mountainous countries, in order to meet the needs of the geographical relief or the weather conditions and reaches nearly 50\% in Norway and Switzerland. In Germany, it is also higher than the European average with a market share of $21 \%$, an increase of 13 points in ten years.

# NEW PASSENGER CARS BY ENERGY 

The share of new cars equipped with a diesel engine in registrations in Western Europe hovered around $52 \%$ until 2015 . Then, from 2016, it fell sharply to $26.4 \%$ in 2020, a decline of almost $50 \%$ in four years. France, Belgium and Spain, starting from diesel market share above $70 \%$, have experienced the largest declines in ten years ( -45 points). Now, in all Western European countries, diesel car sales account for less than half of total sales. Petrol engines have therefore become the majority again from 2016 and represent 47\% of registrations in 2020. In Eastern Europe,
the situation is different with stability on the part of diesel at a lower level (24.4\%), and a share of petrol still high (nearly 60\%), but down 10 points compared to 2019.

2020 has seen an acceleration in the development of electrified vehicles in Europe. In a market down $25 \%$, registrations of electric cars increased by $109 \%$ to $6.7 \%$ market share (+4 points). Those of hybrid cars grew by $71 \%$, representing a gain of 10 points in market share to $18 \%$ of total registrations, including 5.4\% for plug-in hybrids.

- NEW PASSENGER CARS BY ENERGY IN EUROPE IN 2020

The share of diesel in sales is largely influenced by the regulations and taxation of each country. In recent years, it has also been impacted by announcements by national and local authorities aimed at restricting the circulation of combustionpowered cars and encouraging consumers to turn to alternative energies. The European Green Pact has set the goal of achieving 100\% new zeroemission cars by 2035 .

In 2020, diesel car sales fell by 33\% in Western Europe. At the same time, the year was marked by the sharp increase in sales of alternative energy cars. The market share of electric cars increased by 4 points in Germany and 5 points in France. In the Netherlands, where they already accounted for $14 \%$ of sales in 2019, the market share of electric cars reached $21 \%$ in 2020. For the first time in Norway, sales of electric cars accounted
for more than half of total sales (53\%). In Greece, Spain or Italy, the market share of electric cars has increased by 1 to 2 points to represent $2 \%$ of sales in 2020. For plug-in hybrid cars, the same gap is observed between European countries North (market share above 7\%, including 22\% for Norway) and those of the South (around 2.5\%).

In Eastern Europe, non-rechargeable hybrids accounted for $13 \%$ of the market in 2020 compared to $5 \%$ in 2019. Contrary to the evolution in Western Europe, the shares of electric cars and plug-in hybrids remain very low and together represent only $2.4 \%$ of the market in 2020 (compared to 12.1\% in Western Europe).

These observations are in line with the conclusions of the ACEA report «Making the transition to zeroemission mobility» which shows that, despite
the doubling of sales in Europe in 2020, 73\% of these are concentrated in 4 countries (France, Germany, the Netherlands and Sweden). The report highlights a link between GDP per capita and the market share of electrified cars. In countries where GDP per capita is above 46,000 euros, this market share is above $15 \%$, while it is less than $3 \%$ in countries where GDP per capita is below 17,000 euros. The various national public policies such as financial aid for the purchase of an electrified vehicle or traffic restrictions on polluting vehicles also explain these differences. The ACEA also shows that the number of charging stations is correlated with the development of the electrified car market and that 70\% of charging points in Europe are located in only 3 countries (the Netherlands, France and Germany).

# THE PASSENGER CARS IN USE IN EUROPE 

As of January 1, 2019, the number of passenger cars in use in Europe increased by $1.5 \%$ compared to the previous year and amounted to 298 million units. In Western Europe, where car density is high (533 cars per 1,000 inhabitants on average), the number of vehicles increased by $1 \%$ on January 1,2019 , compared to $+1.5 \%$ on average between 2014 and 2019. In the new state members of the European Union and in Turkey, where motorisation rates are generally lower (480 per 1,000 inhabitants on average), the growth rate of the vehicle fleet is more sustained. It increased by
3.5\% on January 1, 2019, compared to an average of $4.4 \%$ between 2014 and 2019. At the start of 2019, this area represents $21 \%$ of the European fleet, compared to $15 \%$ in 2005, and several countries now have rates motorisation identical to the countries of Western Europe.

For the first time since 1992, the share of diesel in the fleet fell in Western Europe (-0.5 point) and stood at $42.7 \%$. On the other hand, it increased by 0.6 point on average in the new EU member states and Turkey and stood at 37.1\%.

The share of cars over 10 years old in Western Europe continues to increase (+1.5 point over one year) and represented $47.6 \%$ of the fleet as of January 1, 2019. This level hides significant disparities between the countries of in Southern Europe, where this share is $66 \%$ on average, and the other Western European countries, where it is $33 \%$ on average. In the new state members, this percentage is even higher with $76 \%$ of the passenger car fleet being more than 10 years old.

## - PASSENGER CARS IN USE ON JANUARY 1 EACH YEAR

- CARS IN USE - GROWTH RATE: RIGHT-HAND SCALE

As a \%

IN THE 12 NEW EU MEMBERS STATES AND TURKEY

As a \%
of all cars in use

Sources: ACEA, professional organisations

As of January 1, 2019, the passenger car fleet in Western Europe amounted to 236 million. The high equipment rates and the crisis affected the growth of the stock, the average rate of which was $1.9 \%$ per year between 1992 and 2009. From 2009, the growth rate slowed down to $1.1 \%$ per year on average. As of January 1, 2019, the customer base increased in all European countries, except in France where it fell by $0.3 \%$. In the new member countries and in Turkey, the increase in the number of customers also slowed down, from $5.2 \%$ per year before 2009 to $3.7 \%$ per year afterwards. As of January 1, 2019, it still grew by $3.5 \%$ compared to the previous year.

After increasing by 2 points per year between 2002 and 2009, the share of diesel engines in the Western European fleet has slowed (+1.2 point per year) and fell for the first time in 2019 to $43 \%$. As of January 1, 2019, this motorisation remains the majority in only five Western European countries, including Spain and France. In Germany, this share is low ( $32 \%$ ) while it is close to the European average ( $42 \%$ ) in the United Kingdom (39\%) and

Italy (44\%). In the new member countries, it dominates in four countries out of ten but is in the minority in the largest fleets such as Poland (32\%), Romania (43\%) or the Czech Republic (36\%).

After hovering around a third between 2000 and 2009, the share of cars over 10 years old in Western Europe has steadily increased to reach $47.6 \%$ on January 1, 2019. This share is particularly high in the countries of Southern Europe where it exceeds 50\% in Italy and 60\% in Spain and Portugal (84\% in Greece). In new entrant countries, where lower-cost demand is mainly satisfied by imports of used vehicles, the share of vehicles over 10 years old is even higher (76\% on average).

# NEW LICHT COMMERCIAL VEHICLES IN EUROPE 

The West European market for light commercial vehicles, badly affected by the 2009 crisis, hovered around 1.5 million units in the following years. From 2014, it progressed steadily until 2019, when it exceeded 2 million units. In 2020, the market fell by $18 \%$ to 1.7 million registrations but remained at levels above the low of 2009 ( 1.3 million).

In all countries, the market for light commercial vehicles fell less sharply than that for individuals, which was more affected by confinements and travel restrictions. These decreases are in a range between $-11 \%$ in Belgium and $-28 \%$ in Portugal. In Germany, France and the United Kingdom, the market fell by $-12 \%,-16 \%$ and $-20 \%$ respectively,
but did not fall back to the level of the 2009 crisis. However, only Germany remained above its level before the crisis (2007). Finally, in Italy, Portugal and Greece, the markets fell to levels below 2009.

In 2020, French groups are down slightly on the light utility vehicle market to 40.5\% market share. This had grown by 8 points between 2007 and 2019, driven in particular by market share gains in the United Kingdom (+2.4 points) and Italy (+1.1 point).

LIGHT COMMERCIAL VEHICLE REGISTRATIONS IN EUROPE In millions of units
(18 COUNTRIES)

As a \% of total market

SHARE OF LIGHT COMMERCIAL VEHICLES IN LIGHT VEHICLE REGISTRATIONS (PASSENGER CARS AND LIGHT COMMERCIAL VEHICLES) IN 2020

MARKET SHARE OF FRENCH MANUFACTURERS IN MAJOR EUROPEAN COUNTRIES

Source: CCFA

Tax treatments are not identical in all European countries, so the share of light commercial vehicles (commercial vehicles under 5.1t) in all light vehicles varies from 8.8\% in Germany to 19.9\% in Ireland. On average, it was 13.6\% in Western Europe in 2020.

In volume, France remains the leading European market, with 402,380 units, ahead of the United Kingdom (300,200 units), Germany (272,590 units), Italy (160,446 units) and Spain (158 860 units) which in 2020 ranks $5^{\text {th }}$.

For many years, the renewal of products and their adaptability to current transport, service and mobility needs in different European countries have boosted sales of these vehicles. Since

2014, this market has been growing steadily and French manufacturers have gained market share there compared to 2007. In 2020, the PSA group represents $25.7 \%$ of the market share; Stellantis, born from its merger with FCA on January 17, 2021, would have represented $34.6 \%$ of the market. In addition, other vehicles sold by Toyota are produced by the group. The Renault group occupies $14.9 \%$ of the market and also produces for other brands (Daimler, Nissan, Mitsubishi).

The van segment (Trafic, Master, Expert, Boxer, etc.) represents almost half of sales and that of small vans (Kangoo, Berlingo, etc.), 23\%. The other segments are occupied mainly by derivatives of passenger cars and pick-ups.

In 2020, all segments combined, five of the ten best-selling models are French brands (Renault Kangoo, Citroën Berlingo, Peugeot Partner, Renault Trafic and Renault Master).

## HEAVY TRUCK MARKET IN EUROPE

The Western European market for commercial vehicles over 5.1 tonnes fell by $25 \%$ in 2020 , to 236,000 units, a level which remains above the low of 2009 (207,000 units). Unlike the 1993 crisis, when the market had returned to high levels five years later, that of 2009 resulted in a new balance, at a lower level around 300,000 units. Since 2014, the market has been growing strongly and steadily (+35\% between 2014 and 2019), particularly in the countries of the South and in France where growth reached $50 \%$. However, the 2020 crisis has erased
the years of growth with a Western European market that is only $2 \%$ above its 2014 level.

All European countries are seeing a sharp drop in their registrations in 2020, between -13\% and -35\%. In Germany, the leading European market with 30\% of volumes sold in Western Europe, registrations fell by $25 \%$. With less dynamic growth than France between 2014 and 2019, the market is even down compared to 2014. In the United Kingdom, the third European market behind France, volumes are also
down compared to 2014. Finally, in France, the strong growth over the 2014-2019 period ( $+47 \%$ ) allowed volumes to be maintained above their 2014 level (+11\%).

NEW HEAVY TRUCK REGISTRATIONS IN WESTERN EUROPE
In thousands of units

RENAULT TRUCKS' MARKET SHARE IN THE MAIN EUROPEAN COUNTRIES

RENAULT TRUCKS' MARKET SHARE IN WESTERN EUROPE (OVER 5 T)

In Europe, the heavy truck market reached a record level in 2007; the recovery of investment and that of world trade since the second half of 2003 had been factors favorable to this recovery. On the other hand, it suffered greatly from the impact of the financial and economic crisis in 2009.

Heavy truck investment cycles are extensive: the high points of the years 2000, 2006 to 2008 thus represent 75\% more than the low point of 1993, i.e. nearly 150,000 additional vehicles. Compared to the two dark years for commercial vehicles, 1993 and 2009, the market recovers more difficultly after the last crisis than in the 1990s. In 2019, with 55,250 units, the French market had however returned to its average level of the years 20062008.

The trend towards heavy trucks is slow and steady. Vehicles of 16 tonnes and more (rigids or tractors)
represent more than 8 out of 10 vehicles.
The share of commercial vehicles using alternative energy (gas, electric, hybrid) remains low (about 3.4\% of the market in Western Europe), but the energy transition is a growing concern for manufacturers and road transport of goods (targets for reducing $\mathrm{CO}_{2}$ emissions, traffic restrictions in the city and sustainable urban logistics). The NGV market is the most developed and in some countries (Belgium, Italy, Latvia, Sweden), its market share exceeds $4 \%$ in 2020. The market share of electric vehicles remains very low in $2020(0.4 \%)$ but the offer is beginning to expand in the urban delivery segments and will soon be extended to other uses (regional transport, construction).

The international development of Renault Trucks has been affected by the fall in the Southern

European markets, which accounted for more than a quarter of registrations in Western Europe in 2002, compared to $18 \%$ in 2020.

Renault Trucks' market share in Western Europe has risen slowly since the low point of 2014 (7.6\%) but has fallen since 2018 and stands at $7.8 \%$ in 2020.

On the whole of the European market for vehicles over 6 tonnes, the French manufacturer nevertheless recorded a stable market share of $8.5 \%$ in 2020 . With an unchanged market share in the segment of vehicles over 16 tonnes at 8.8\% and a market share of intermediate ranges (6-16 tonnes) at $6.6 \%$, up 0.3 point. Outside Europe, Renault Trucks sells significant volumes in Africa (particularly in Algeria with a 48\% market share for vehicles over 16 tonnes) and in the Middle East (Turkey).

## FRENCH GROUPS IN THE NEW MEMBER STATES OF THE EUROPEAN UNION

## Market share of French groups on new light commercial vehicles sold in the new EU member states

Vehicle production in the new EU countries amounted to 3.6 million units in 2020 ( $-18 \%$ compared to 2019). With the health crisis, the volumes produced fell back
to the level of 2014, but nevertheless remained 18\% higher than their level of 2007. Sales of new vehicles fell by $23 \%$ to 1.3 million units, a volume of market equivalent to that of 2016. The difference between production and sales of new vehicles is now around 2.2 million vehicles.

French groups have been commercially present in this area for many years and also have industrial facilities there: PSA in Slovakia, in the Czech Republic (with Toyota until December 31, 2020) and in Poland (with
the integration of Opel and soon with the FCA plant, due to the creation of Stellantis); Renault in Slovenia and especially in Romania with Dacia (260,000 units). All of these sites accounted for production of nearly 900,000 units in 2020. Registrations of new light vehicles by French groups in these countries amounted to 312,000 units in 2020, i.e. 24\% market share. The market is expected to grow further given the remaining gaps in some of these countries in terms of automobile densities, compared to Western Europe.

Sources: CCFA, OICA

If $E U-15$ is now seen as an automobile market whose demand mainly concerns renewal, this is not yet the case in all the new EU member countries. The average motorisation rate of 480 private cars per 1000 inhabitants (compared to 533 in Western Europe) hides large disparities between countries. It is below 450 in Latvia, Romania, Hungary, Croatia and Slovakia, but exceeds 550 in Poland, Estonia, Slovenia and the Czech Republic. Poland (38\%) and the Czech Republic (18\%) together account for 55\% of passenger car registrations in the area, followed by Hungary and Romania (11\%). For light commercial vehicles, the largest market remains Poland ( $40 \%$ ), but it is followed by Hungary, which represents $16 \%$ of the market.

In 2020, the automotive markets in the new Member States of the European Union were affected by the health crisis to the same extent as the markets in Western Europe. Passenger car registrations fell by $23 \%$ in the region as a whole (compared to -25\% for Western Europe). The declines range from -19\% in the Czech Republic and Hungary to -30\% or more in Slovenia, Croatia and Bulgaria. The light commercial vehicle market fell by $19 \%$ (compared to $-18 \%$ in the 18 Western European countries). The main markets of Poland, the Czech Republic and Hungary fell slightly less than the average (-16\%). The industrial vehicle market fell by 35\% compared to $-25 \%$ in Western Europe.

The technical characteristics (displacements, power, bodywork) of passenger cars registered in this zone are close to those of Western Europe, with the exception of those relating to motorisation. Nearly $60 \%$ of cars are equipped with a petrol engine (compared to $47 \%$ in Western European countries), but this share is tending to decrease ( $70 \%$ in 2019) in favour of new engines. In 2020, sales of electric cars increased by $150 \%$, but their market share remains very low (1.4\%) compared to Western Europe (6.7\%). Hybrid engines have also developed strongly (+87\% in 2020) and reach 14.2\% of registrations (compared to 18\% in Western Europe) thanks to the segment of non-rechargeable hybrid cars, which weighs the heaviest with $13.2 \%$ of the market, compared to 12.6 \% in Western Europe.

## THE AUTOMOTIVE INDUSTRY IN THE EUROPEAN UNION

In 2018, the European automotive industry provided employment for 2.7 million people, i.e. $8.5 \%$ of industrial jobs in Europe. Jobs are divided between the construction of vehicles which represents $44 \%$ of the people employed, the manufacture of automotive equipment ( $49 \%$ of jobs) and the manufacture of bodies and trailers ( $7 \%$ of jobs).

In the 7 countries of Western Europe where the automotive industry is historically present, the workforce in the sector fell sharply between 2005 and 2010 (-270,000 people), while it increased in the 7 new entrants $(+190,000)$. Then, thanks to the growth of
markets and the promotion of products manufactured in this area, the workforce increased by 220,000 people between 2010 and 2018, in particular thanks to Germany (+132,000 people), the United Kingdom $(+30,000)$ and Spain (+22,000), without however returning to their 2005 level $(-50,000)$. As for France, it benefited little from this context $(+14,000)$ due to its reduced competitiveness. In Eastern Europe, the increase in the workforce continued to reach $+460,000$ people over the period 2005-2018.

In 2018, the value added per person employed amounted to 82,000 euros on average in Europe,
compared to 51,000 euros in 2012. In France, it was 85,000 euros compared to 118,000 euros in Germany. Staff costs per person employed amount to 64,000 euros in France compared to 83,000 euros in Germany, the European average being 53,000 euros. Social charges represent $30 \%$ of these expenses in France, compared to $18 \%$ in Germany and $21 \%$ on average in Europe

The automotive industry, one of the essential sectors of the European economy, includes:

- manufacture of motor vehicles;
- manufacture of bodies and trailers;
- the manufacture of automotive equipment.

The data gathered in this table comes from national business surveys, harmonised by Eurostat. The difficulties encountered at both national and European level, both for the collection and for the standardisation of data, do not allow us to have reliable figures after 2018.

In 2018, France accounted for 9\% of the total workforce in the automotive industry in the European Union. Germany accounted for $34 \%$ and Spain, Italy and the United Kingdom around 6\% each. New member states, represented here by 7 countries (Hungary, Poland,

Czech Republic, Romania, Slovakia, Slovenia and Bulgaria), record a growing share of the total workforce, which reached 30\% in 2018.
On average in the European Union, the automotive industry accounts for $8.5 \%$ of industrial jobs, but it accounts for $11.2 \%$ of jobs in Germany, $13.4 \%$ in the Czech Republic, 14.2\% in Sweden and 15.5 \% in Romania and Slovakia.

Automotive industries remain very different depending on the country, in terms of structure and wage costs. In Germany and Sweden, more than 60\% of the workforce in the automotive industry is employed in automotive manufacturing. This share is $49 \%$ in France, $45 \%$ in Spain and $41 \%$ in Italy, while it is around $18 \%$ in the seven new countries. Expressed in base 100 for the average of the 7 entering countries, the expenditure index per employed person amounts to

338 in France, 345 in Sweden and 439 in Germany, i.e. wage costs which are up to 4 times higher than in Eastern countries.

In addition to direct jobs, the automotive industry also generates indirect jobs which are estimated by ACEA at more than a third of direct jobs. The industrial sector therefore directly and indirectly employs 3.7 million people in Europe, or $11.5 \%$ of industrial jobs. By adding all jobs related to the automobile in services (trade, repair, rental, insurance), transport (people and goods) and construction (road maintenance), the sector directly or indirectly employs 14.6 million people, or $6.7 \%$ of all jobs in Europe.

## PSA Group (Stellantis from 01/17/2021): www.stellantis.com

In 2020, in the context of a global pandemic, PSA group sales amounted to 2.5 million vehicles. Its market share recovered in the 4th quarter of 2020 in the main regions, with significant growth in Africa and the Middle East.

The PSA group relies on a workforce of more than 224,000 people worldwide, including 51,000 (excluding Faurecia) in France, spread over some twenty sites: assembly plants, engine production (Trémery) and mechanics; R\&D centers (Vélizy), spare parts stores (Vesoul). Downstream development is taking place thanks to Distrigo and MisterAuto in the distribution of parts; in the automotive trade, the group is increasing its presence on the second-hand market with AramisAuto. With the Free2Move brand, it develops mobility services, including internationally.

In the technological field, the group has set itself the objective of continuing to improve the $\mathrm{CO}_{2}$ efficiency of its heat engines and continuing to develop its electric range in all its components and continuing to invest in automation and connectivity. cars. All of its brands now offer either plug-in hybrid or all-electric versions for each new launch.

In 2019, the group invested more than 2.5 billion euros in tangible investments and spent 2.4 billion euros on research and development in 2020.

Until 2021, the international development strategy was essentially based on sustainable and targeted cooperation with other manufacturers. In China, the group cooperates with Dongfeng Motor, with which it is developing a strategic partnership. It continues to set up several production or assembly plants or has projects in markets with development potential (Turkey, Algeria, India with CK Birla). On January 17, 2021, the group merged with Fiat Chrysler Automobiles to create Stellantis, an international company with 400,000 employees made up of 14 brands. The strategy of the new group is being put in place gradually, but the pursuit of electrification remains a central point.

## Renault group: www.renault.com

In 2020, the Renault group sold 2.9 million vehicles worldwide. After a first half of 2020 where the group's
main markets were severely impacted by the pandemic and the associated containment measures, the second half of the year shows better resilience: the group's sales in Europe remained in line with the markets. On the European electric market, Renault confirms its leadership by doubling its sales of electric vehicles in 2020.

The cooperation initiated in 1999 with Nissan within the Alliance has been optimised and expanded over time with the integration of Mitsubishi in 2016. New synergies (industrial level, electric vehicles, support functions, etc.) and new projects are implemented. The strategic partnership with AvtoVAZ (Lada) has reached a new stage with the integration of the Russian manufacturer into the Renault group. Within the Alliance, the leader/follower concept, which leads to a rationalisation of the financial efforts allocated to developments, continues to be deployed for various technical projects (platforms, components, etc.). Finally, the collaboration with Daimler continues with the production of commercial vehicles in Maubeuge.

The group's priorities in terms of innovation are the electric, connected and autonomous vehicle and mobility services. It also develops partnerships with universities, partner companies and research organisations (CEA). In 2019, Renault introduced hybrid motorisation (E-TECH) in its offer and is experimenting with hydrogen technology in its range of commercial vehicles. The group is also actively working to develop the use of recycled materials and the recycling of end-of-life vehicles. The new Re-factory project in Flins announced in November 2020 is a further step in this direction.

In 2020, the Renault group employs 170,000 people worldwide, including 46,000 in France at some fifteen sites: assembly, engine and mechanical production plants (Cléon, Le Mans); R\&D centres (Guyancourt); head office, etc. Its downstream presence is based on Renault Retail Group, which distributes new and used vehicles as well as parts.

In 2020, the Renault group invested 2.7 billion euros in tangible investments and spent 2.6 billion euros on research and development.

At the beginning of 2021, the group presented its new
"Renaulution" strategic plan, which aims to reorient the strategy by moving from volume objectives to value creation. The aim is to restore competitiveness by improving engineering and production efficiency, building on the Alliance's technological mastery and accelerating data, mobility and energy services. The industrial strengths and the electrical leadership in Europe constitute a basis for increasing the profitability of the 4 differentiated units based on the 4 brands: Renault, Dacia-Lada, Alpine and Mobilize.

## Renault Trucks: www.renault-trucks.com

With 41,117 vehicles invoiced worldwide, Renault Trucks experienced a drop in these volumes in 2020 but maintained its market share. Renault Trucks assembles its truck models in France at its factories in Bourg-en-Bresse and Blainville-sur-Orne and relies on partners for local assembly outside Western Europe, including Saudi Arabia.

Part of the Volvo group, which employs 100,000 people worldwide, Renault Trucks has 10,000 employees, fourfifths of whom are in France. In addition to complete vehicle assembly, Renault Trucks has engine assembly and stamping activities in Vénissieux, studies and research in Saint-Priest, and parts reconditioning in Limoges. In addition, in Bourg-en-Bresse, Renault Trucks has created a workshop specialising in the transformation of used trucks: the Used Trucks Factory.

The manufacturer now offers a complete range of alternative energy vehicles (gas, biodiesel, electric) and a range of services including solutions promoting fuel economy (Optifuel Solutions) but also predictive maintenance services (launch of Start \& Drive Excellence Predict). It continues to invest massively in electric mobility to be part of a trajectory aiming for a $100 \%$ carbon neutral offer from 2040 . Since March 2020, it has started the series production of its second generation of electric vehicles in its factory in Blainville-sur-Orne. Along with the Renault Trucks D Z.E., the D Wide Z.E. and the Master Z.E., its range extends from 3.1 to 26 tonnes and meets the urban requirements of delivery, distribution or waste collection.

# WORLD PRODUCTION OF FRENCH GROUPS 

In 2020, the global production of French groups fell by $28 \%$ to 5.2 million vehicles. The collapse of the European markets on which they had strengthened in recent years, in particular thanks to external growth operations (integration of Lada into the Renault group on January 1, 2017; integration of Opel into the PSA group on August 1, 2017) strongly affected their production. Between 1996 and 2019, their production had nevertheless increased by $92 \%$, i.e. an average annual growth of $3 \%$, both thanks to the increase in outlets in Europe outside France, then, subsequently, to those outside Europe.

Passenger car production amounted to 4.4 million units, down $28 \%$ after an initial decline in 2019 and a record 2018. This level is lower than the trough of 2009 and is back to that observed at the end of

1999-beginning of 2000. The production of light commercial vehicles stood at 791,000 units, i.e. a drop of $23 \%$ compared to 2019 but at a level which remains higher to the average for the years 20092014 ( 710,000 units), following the 2009 crisis.

French groups have a great diversity of sites: historic factories (Sochaux, Sandouville), recent factories in emerging countries (Tangiers, Kenitra), large ones (Vigo, Pitesti), those producing a single type of model (Trnava, Novo Mesto) or great diversity (Porto Réal, Togliatti), those of light commercial vehicles or their derivatives (Hordain, Batilly), those of partnerships (Val di Sangro, Chennai) and those of small size.

[^3]
# MARKETS FOR NEW VEHICLES FROM FRENCH GROUPS 

In 2020, the share of outside France in French groups' sales fell by one point in a global passenger car market down 16\%. Sales in France have been growing steadily since 2012, but the share of the French market in outlets for French groups is now around $20 \%$. Thus, foreign markets now represent 80\% of outlets for French manufacturers, compared to two-thirds in 2000 and less than 60\% in 1990.

Between 2013 and 2019, the share of deliveries by French manufacturers to the European Union increased sharply, from $38 \%$ to $60 \%$. This is explained both by the partial recovery of the

NEW LIGHT COMMERCIAL VEHICLES In thousands of units

NEW LIGHT COMMERCIAL VEHICLES
In thousands of units (UP TO 5T)

Southern European markets, the integration of Opel, but also by the fall in part of the world markets. In 2020, this share fell to $48 \%$ due to the United Kingdom's exit from the EU but also the sharp drop in EU markets. By adding the flows to the United Kingdom, the share of deliveries to this zone amounts to $55 \%$ in 2020, i.e. a decline of 5 points compared to 2019. Conversely, the share of deliveries to the CIS zone (including Turkey) increased in 2020 due to the better resilience of the markets in this area and an increase in registrations in Turkey after two years of decline.

NEW HEAVY TRUCKS (OVER 5T)

(1) Since 2012, the scope of heavy trucks deals with invoices for 7 t and more (see note page 81).

NEW HEAVY TRUCKS (OVER 5T)

NEW HEAVY TRUCKS (OVER 5T)
In thousands of unit

French groups have developed their activities throughout the world following the opening up and development of markets in emerging countries. In 1990, the French market for new passenger cars represented 2.3 million units, compared to 3.3 million units produced worldwide by the PSA and Renault groups. These data amounted to 2.2 and 6.2 million cars respectively in 2019. With the health crisis, registrations in France fell to 1.6 million units
and the global production of French manufacturers to 4.5 million units.

From 2009 to 2015, the impact of the crisis in countries where French groups have a strong presence had affected their deliveries of passenger cars outside France. In 2020, they fell by $26 \%$ to 3.5 million units, i.e. $10 \%$ below their low point in 2013. Deliveries of light commercial vehicles fell by
$24 \%$ in 2020 to 573,000 units but this level remains higher than the levels observed before 2016. Finally, deliveries of industrial vehicles fell by $33 \%$ in 2020 (14,000 units), i.e. a lowest level since 2009.

In 2020, the value added per employee in the automotive sector amounted to 93,000 euros, down sharply compared to 2019. The health crisis has brutally slowed down activity, just like what happened in 2009 (financial crisis) and in 2012 (low point in the automotive cycle).

The value added per employee in car manufacturing is higher than in industry. In 2019, it was 105,000 euros against 92,000 euros on average in the industry. Between 2012 and 2019, it almost doubled at current prices, thanks to the growth of the European market and outlets, as well as the internal efforts of manufacturers in terms of productivity.

The share of turnover exported in car manufacturing is around $60 \%$, compared to an average of $39 \%$ in industry.

At the crossroads of many and various techniques, the automobile requires significant investment: since
the 2009 crisis, automobile manufacturing devotes an average of $2.4 \%$ of its turnover to it each year. This ratio remains high in 2020 (2.8\%), in a context of declining turnover and the maintenance of the tangible investments necessary for the energy transition. On average, the automotive industry annually makes about 6\% of total industry investment.

In addition, the automotive branch has a significant impact on the other branches, in particular through the purchases it makes. Total purchases by the automotive branch amounted to 55 billion euros in 2019, up 43\% since 2013.

CAPITAL EXPENDITURE BY THE AUTOMOTIVE MANUFACTURING (1)

VALUE ADDED PRODUCED BY THE AUTOMOTIVE MANUFACTURING (1) In $2015 €$ thousand per employee

DOMESTIC AND EXPORT SALES BY THE AUTOMOTIVE MANUFACTURING (1)

INSEE produces annual business surveys each year, which are one of the main sources of knowledge of French industry. A major overhaul of these surveys has been carried out, with the new ESANE information system. In addition, a new classification of economic activity was introduced at the start of 2008 (see pages 88 and 89).

The automotive industry sector includes companies whose main activity is the construction of motor vehicles, motor vehicle bodies, caravans and leisure vehicles, but also, upstream, the manufacture of automotive equipment. However, some products such as tyres, plastics, capital goods and glass escape classification because
they appear in other classifications of activities (see page 69).

After 2004, in line with the increase in vehicle production, the added value (excluding tax) of car manufacturing, in constant euros and per employee, fell under the impact of various factors: costs linked to new environmental standards, stagnation, then fall in the automotive markets of Western Europe. Then, from 2013, it increased again and almost doubled in 7 years. In order to develop new models and optimise production capacities, automobile manufacturing devoted an average of $2.4 \%$ of its turnover to its investments, i.e. more than 2 billion euros per year. In addition
to these tangible investments, there are intangible investments which are not included in these figures (see page 34 on research and development expenses).

The share of export turnover has grown steadily since 1990, when it reached $38 \%$, now hovering around $60 \%$, compared to $39 \%$ for the industry as a whole.

THE AUTOMOTIVE INDUSTRY IN THE REGIONS

By taking into account direct jobs (manufacturers' production and research sites), indirect jobs (suppliers' sites) and induced jobs (generated by the activity of the preceding companies), the
automobile economy often constitutes an essential pillar of the local economy.

## 4.1 <br> Units of value added in the national economy generated by one unit of value added in the automotive sector

- VALUE ADDED MULTIPLIERS BY SECTOR (EXCLUDING COKING-REFINING)

| Sectors | Agriculture | Agri-food products | Capital goods | Automotive | Aeronautics and space | Other transport equipment (excl. aeronautics) | Other industrial products | Power, water, waste | Construction | Trade, services |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 2.3 | 2.8 | 2.3 | 4.1 | 4.8 | 3.0 | 2.3 | 2.1 | 2.0 | 1.5 |

[^4]The automotive sector has powerful ripple effects on the rest of the economy. According to INSEE, one unit of added value in the automotive sector generates 4.1 units of added value in the national economy. Thus, the automotive industry has the largest added value multiplier, after aeronautical and space construction. Furthermore, an industrial site generates local economic activity that is not limited to its employees alone (direct employment). Indirect and induced jobs are also created, as shown by various studies by INSEE in the regions. Indirect jobs correspond to personnel employed by suppliers, subcontractors and service providers, while induced jobs are those necessary to satisfy the consumption of employees (direct and indirect) and their families.

The Ile-de-France Planning and Urban Planning Institute estimates that in 2018, the automotive sector in this region comprised around 73,000 employees in 1,600 establishments; $57 \%$ of the workforce works with body builders, $13 \%$ with equipment manufacturers, $19 \%$ with industrial suppliers and $11 \%$ in technological services (design offices and IT services and engineering companies). In the Seine Valley, which brings together the departments in the west of Île-deFrance and the Normandy departments on the coast or crossed by the Seine, there are 54,400
jobs directly linked to the automotive industry, including 42,530 in car manufacturing. The broader automotive sector, which includes manufacturing, trade and maintenance-repair activities, employs 110,000 people.

The automotive industry is also a structuring sector for the Hauts-de-France economy with 56,000 direct and indirect jobs, including 15,400 in automobile construction, 15,000 in the manufacture of automobile equipment and 26,300 in the supply of materials, intermediate products and services. Bourgogne-Franche-Comté, traditionally closely linked to the automotive and metallurgical sectors, had 45,000 non-temporary employees in the automotive sector in 2015, including 14,570 in automotive construction and 14,820 in automotive equipment manufacturing. Despite the absence of major manufacturers established locally, the Center region has 29,000 jobs in the automotive sector where subcontractors, material suppliers and service providers gravitate around world-class equipment manufacturers.

In all of these regions, the number of jobs in the automotive industry has declined over the past twenty years according to ACOSS data. Between 2008 and 2015, the decline was $24 \%$ on average in France and 11\% between 2015 and 2020.

The research and development activities of the entire automotive industry are located in île-de-France (eg PSA in Vélizy and Renault in Guyancourt), but also in other regions. INSEE Nord-Pas-de-Calais-Picardie estimated that $12 \%$ ( $13 \%$ on average in France) of Domestic Research and Development Spending (DRDS) in the region was carried out by the automotive industry in 2013. In Bourgogne-Franche-Comté, in 2016, the automotive industry accounted for, according to INSEE, $70 \%$ of research and development expenditure by mid-sized companies and large companies established locally.

In 2019, 11 Regional Associations of the Automotive Industry (ARIA), regional relays of the PFA, Automotive Industry \& Mobilities, bring together companies (manufacturers, equipment manufacturers and other suppliers) of the automotive sector in the region, with public authorities and educational and research institutions. Their missions are diverse: increasing competitiveness, improving industrial performance, access to new outlets, emergence of new projects, promotion of the image of the sector in the region. They also cooperate with automotive competitiveness clusters, or even integrate them.

In a highly competitive global market, French automotive groups must be competitive in their country of origin and face factors common to the entire industry. These include wage costs, the weight of compulsory levies on factors of production and the exchange rate. Others are specific to the automotive sector, such as the opening of the base market to competition. All of these factors weigh on margin rates (ratio between gross operating surplus and gross value added). The latter has an impact on the ability of companies to invest in production (modernisation of sites), product development, research and development in the energy transition, digital technology and new mobility. In order to cope with these current revolutions, investments are set to increase (see pages 24, 28, 88 and 89).

In France, after the 2009 crisis, the government implemented a policy promoting competitiveness; the manufacturers have also activated all the
internal levers for the development of their activity and the maintenance of the industrial and research sites in France. All of these actions have had results, but the French industrial tool retains a degraded economic competitiveness compared, in particular, to its European environment.

INSEE defines production taxes as all taxes that companies pay as a result of their production activities, regardless of the quantity or value of the goods and services produced or sold. In France, they represent, in 2020, $3.7 \%$ of GDP, compared to $1.3 \%$ in Italy, $1.1 \%$ in Spain and $0.5 \%$ in Germany according to Eurostat. The CNI also estimates that more than $20 \%$ of the revenue from three (business property tax - CFE, business value added tax - CVAE, corporate social solidarity contribution - C3S) of the five main taxes on production comes from the industry, which represents, in 2020, 13\% of the added value of the whole economy. Industry is a sector highly
exposed to international competition and only its investment capacity allows it to strengthen nonprice competitiveness.

LABOR COSTS IN MANUFACTURING INDUSTRY
Results of the four-yearly ECMOSS survey and extrapolation using the quarterly index of labor costs

Source: Eurostat, Rexecode calculation

MARGIN RATE (GOS/VA) AND INVESTMENT RATE (GFCF/GOS) OF THE AUTOMOTIVE INDUSTRY

The margin rate is the ratio of the gross operating surplus to the added value before tax, and the investment rate is the ratio of gross fixed capital formation to value added, before tax.
Source: INSEE (National account, base 2014)

Competitiveness is the ability of an industry to compete and grow in markets. It is relative in the sense that it is the result of a confrontation with other players in the sector present on the market.

The French automotive industry must ensure a performance comparable to that of its global competitors in order to continue to develop. Among the factors that affect the competitiveness of French industry are wage costs, which are linked in particular to the weight of social charges on the labour factor. Between 2000 and 2009, labour costs in the manufacturing industry moved closer to German costs and moved away from average costs in the euro zone, which penalised the competitiveness of French manufacturers and their suppliers in France.

In 2012, in order to promote the competitiveness of companies, the government introduced the Competitiveness and Employment Tax Credit (CICE), based on the payroll base, excluding wages above 2.5 times the minimum wage. The rate of tax reduction fell from 4\% of the gross payroll in 2013 to $7 \%$ in 2017 . From 2019, the CICE is transformed into a permanent reduction in employers' social security contributions. Nevertheless, the weight of social charges on the
labour factor in France continues to be one of the highest in the European Union, including the euro zone. It is higher than those of the United Kingdom, Italy, Spain, and even more than those of Eastern Europe. Under these conditions, the production in France of vehicles in the lower range segment is no longer profitable. Other measures also relating to the tax burden on companies could be taken in order to continue to bring the production conditions of the France site closer to those of the euro zone average. In 2020, production capacity utilisation rates fell, affecting the competitiveness of sites in most eurozone countries.

Beyond the problems of overall competitiveness of the economy or industry (salary, social and tax costs), there are also factors of competitiveness specific to the French automobile industry, which result both from the characteristics of the good automotive industry and those of the global automotive industry.

Changes in exchange rates can significantly alter the terms of trade because of the significant, and growing, share of production outside the euro area. The latter accounted for $60 \%$ of external outlets for passenger cars in 2020, compared to $47 \%$ in 2002. In 2020, the euro remains on average at a
lower level than between 2009 and 2014 against the dollar and the won, but it has risen slightly compared to 2019.

On the other hand, there are factors related to the opening of the market, whether internal or external. In general, the domestic outlet, known as the "base market", constitutes a solid pillar for nurturing, via international development and innovation, growth in external markets. For the French automotive industry, the French market and especially the European market constitute this base market; it is open to competition and non-European manufacturers occupy a significant and constantly growing share. In other car manufacturing countries, such as Japan, market access is more difficult and local manufacturers therefore have a larger base market on which to base their international development.

## COMPETITIVE FACTORS IN THE FRENCH AUTOMOTIVE INDUSTRY

SHARE OF FOREIGN BRANDS IN PASSENGER CAR MARKETS

(1) USA: market share based on light vehicles. The Big Three are General Motors, Ford and Chrysler (excluding European brands).

## 60\% <br> Share from outside the euro zone in the external outiets of French groups

The prices of raw materials, which can impact the production costs of user companies, experience significant fluctuations, including during the same year. Expressed in euros, the prices of raw materials had experienced significant increases from 2001 to 2012 and the impact of these in the final sales prices had proved difficult, in a context of intense competition and arbitration in terms of consumption. within households. Prices then hit
a low point at the beginning of 2016, then evolved in a contrasting manner depending on the product and fluctuated sharply during the year. Steel and rubber saw their prices increase sharply in 2016 to reach a peak in February 2017. But after this date, the price of rubber fell sharply, while that of steel remained at a high level, reaching a new peak in September 2018, then to decrease during 2019. Conversely, the price of platinum fell continuously until January 2019, then increased steadily throughout the year. Finally, with regard to the price of crude oil, its variations are much more erratic. After falling sharply at the end of 2018, it showed an upward trend during 2019.

In 2020, prices fell sharply again with the slowdown in global activity and reached a low point in April and August for steel. Then from this low point, prices rose continuously, in particular for steel which reached, from January 2021, its highest level ever recorded. The strength of the recovery after the Covid crisis largely explains this price surge.

## 2018 <br> Signature of the 20182022 sector contract

Over the past ten years, the automotive industry has had to consolidate facing several types of events. The first was the 2008-2009 crisis which severely affected European markets and production in France. The automotive industry production index calculated by INSEE fell sharply in 2008. Measured in base 100 in 2015, it fell from 143 in January 2008 to 70 in December and remained at a very low level in 2009 (90 on average per year). Then, it rebounded in 20102011 and, after fluctuating around 93 until 2013, it progressed steadily to return above 100 from 2015. Between 2015 and 2018, the production index increased $11 \%$ compared to $3 \%$ for the industry as a whole. However, in 2020, with the health crisis,
production suffered a shock again, this time on an unprecedented scale. The automotive production index fell by 28\% in 2020 compared to 10\% for the whole industry.

The sector must also deal with three major disruptions (technological, digital and societal) which are leading to a deep reorganisation of the value chain. Companies must adapt to the reduction in their traditional outlets linked to thermal vehicles and invest in new products by training the workforce in future technologies.

Since 2009, the automotive sector has been structured around the Automotive Industry Platform (PFA), set up by French automotive groups and their suppliers, gathered within the Liaison Committee of Automotive Suppliers (CLIFA). Within the framework of the National Industry Council
(CNI), the Automotive Sector Strategic Committee (CSF) has been set up. The CSF Automobile brings together the entire sector, from upstream to downstream, including employee unions. In the spring of 2018, a new sector contract was signed in order to set the roadmap for the 2018-2022 period. With the 2020 health crisis which impacted the entire economy, including the automotive sector (fall in markets and production, automotive support plan), it became necessary to adapt the CSFA's roadmap in order to strengthen the measures most essential to the transition, while taking into account this new economic context. An amendment to the sector contract was therefore signed in April 2021.

INDUSTRIAL PRODUCTION INDEX (CVS-CJO DATA)

2009 financial and economic crisis had a major impact on the automotive sector, from suppliers (upstream) to the sale/maintenance of vehicles (downstream), including the transport of goods, the manufacturers of goods equipment or business services, including research and development. Due to the contraction of activity, degraded competitiveness and increased competition, the fabric has become fragile. To cope with this context, the PFA then set priorities: "lean manufacturing", tomorrow's skills and professions, better management of communication and the medium and long-term strategy on the competitiveness of manufacturers and from their suppliers.

Since 2010, it has been supported at the regional level by the Regional Automobile Industry Associations (ARIA). After an initial active phase, it was consolidated in 2012, notably around the Automotive Technical Committee (CTA) and its two councils, the Automotive Technical Standardisation Council (CSTA) and the Automotive Research Council (CRA). Five programs have been defined: 2L100 (car consuming 2L per 100 km), Autonomous Vehicle, VALdriv PLM (structuring and federating the digital transformation of the sector), FORCE (Optimised and Realistic Fiber Carbon Economy) and the Factory of the Future. In addition, the PFA works in partnership with the competitiveness clusters. It
is also a stakeholder in the CSF Automotive. The CSF Automotive was created in 2010 within the current CNI, following the Estates General of Industry concluded the same year, which now includes 15 other committees. It brings together automobile and industrial vehicle manufacturers established in the territory, "tier 1" equipment manufacturers and a large number of SMEs and ETIs, automotive suppliers and belonging to different sectors (mechanical, plastics, stamping, foundry, etc.). The downstream of the sector (distribution, repairs) is also present, like the R\&D players, in particular the competitiveness clusters and the major public research organisations (IFPEN, IFSTTAR). Branch employee unions also participate.

The PFA entered a new stage at the end of 2017. Its missions relate to the animation of the dynamics of innovation, the action in favour of competitiveness throughout the sector, the work of anticipation in terms of jobs and skills, the expression of the common positions of the sector, coordination of the organisation of trade fairs and sector communication.

In May 2018, a new sector contract was signed for the period 2018-2022. It includes four structuring projects: being a player in the energy and ecological transition, creating the ecosystem of the autonomous vehicle and experimenting on a large scale to offer
new mobility services, anticipating the evolution of skills and employment needs, and strengthening competitiveness. of the automotive industry.

In 2020, the health crisis led to a historic decline in economic activity which further weakened companies in the sector and led the government to put in place emergency measures (cash support, employment) and to launch, in May 2020, a vast car support plan to get out of the crisis. An amendment to the strategic sector contract was also signed in April 2021 to take into account the support plan and strengthen actions in favour of ecological transition: additional financial envelopes have been provided by the State, in particular to accelerate the deployment of charging stations. The sector has strengthened its commitments to electrification by, for example, setting a development path for electric light and heavy commercial vehicles. A roadmap for supporting employees has also been put in place.

## RESPONSE FUNDS, RESEARCH TAX CREDIT, FUTURE INVESTMENTS

The automobile requires significant physical investments (production sites, etc.), amortised over long periods. During their design and before marketing, the vehicles also required work over several years in research centres, in a process of permanent progress, in order to be able to respond in particular to societal demands, whether related to safety or the environment (electrification, hydrogen, etc.). Manufacturers must also respond to new digital issues (autonomous and connected cars) and new mobility services. The automotive industry is therefore a capital-intensive industry which, overall, has significant financing needs.

During 2009 financial crisis, this peculiarity weighed on the automotive industry and the public authorities set up structural instruments to promote long-term financing. Created in 2009 under the name of the Automotive Equipment Manufacturers Modernisation Fund, which became the Automotive Future Fund (FAA) in 2015, this fund's mission is to contribute to the development and consolidation of strategic equipment manufacturers for the automotive sector, in order to increase their profitability and help them establish lasting partnerships with manufacturers. In November 2020, this fund entered phase 2
and was integrated into the automotive support plan launched by the government in May 2020 to support the sector in its changes and support it in this period of crisis. Initially endowed with 525 million euros, increased to 600 million by the support plan, this fund will be spread over a period of 15 years in order to be able to respond to the challenges of the sector in the long term. It will also benefit companies that have suffered from the brutal economic consequences of the health crisis, with envelopes ranging from 3 to 50 million euros invested in equity or quasi-equity.

The Research Tax Credit (CIR), a tax measure created in 1983, simplified and amplified by the 2008 Finance Act, makes it possible to make up for the lack of fiscal and social competitiveness of France compared to other major countries in which car manufacturers are present, in particular through their R\&D centers. In 2019, 7.4\% of the tax credit granted for research benefited the automotive industry and $1.4 \%$ for innovation.

The automotive recovery plan also provides public aid of up to 150 million euros to support R\&D and innovation. They will be deployed as part of the 4th Investments for the Future Program (PIA) over the
period 2021-2025, in line with the priorities defined within CORAM (Steering Committee for Automotive and Mobility Research). This committee, set up in 2020 as part of the automotive support plan, has drawn up a roadmap which makes it possible to identify priorities in terms of short-term innovation (development of strategic components for the manufacture of electric and plug-in hybrid vehicles) and in the long term (development of hydrogen systems for mobility, development of autonomous and connected vehicles).

> 2015
> First year of existence of the Automotive Future Fund
> 2020
> Launch of the Automotive Future Fund 2

## - INVESTMENT AND SUPPORT FUNDS FOR THE AUTOMOTIVE SECTOR

|  | Objectives and attributions |
| :---: | :---: |
| Automotive Future Fund 2 (launched in November 2020) | Following on from the FAA launched in 2009, which has come to the end of its investment period, the FAA 2 launched by Renault, PSA and Bpifrance is part of the 2020 recovery plan. Managed by Bpifrance, it aims to accelerate the growth and innovation capacity of French automotive subcontractors. Its total duration will be 15 years and its investment period 5 years. $80 \%$ of the Fund, i.e. up to $€ 420$ million, will be invested in approximately fifteen subcontractor groups, while the remaining $20 \%$, i.e. up to $€ 105$ million, will be invested in funds of funds (private and complementary to the FAA 2). |
| Support fund for employees in the automotive sector | Intended to finance exceptional support and professional retraining actions for redundant employees in the automotive sector. The resources of the fund consist of financial contributions from the State and voluntary contributions from companies. The management of the fund and the implementation of support and professional retraining measures are entrusted, on behalf of the State, to Pôle Emploi. The support is planned until June 2023. |
| AMI CORAM 2021 (Call for demonstration within the framework of CORAM) | Subsidies and advances of $30 \%$ to $50 \%$ (depending on the size of the company) of the amount of the investment for R\&D projects that fall within the roadmap of the Automotive and Mobility Research Steering Committee (electric vehicle, hydrogen, innovative materials, circular economy, connected and autonomous vehicles). |

Source: Bpifrance

In the context of long-term financing, since its creation, the Strategic Investment Fund (FSI), which became Bpifrance Participations with the creation of the public investment bank Bpifrance, had invested in three companies in the automotive sector. As for the Fund for the Modernisation of Automotive Equipment Manufacturers Rank 1 (FMEA Rank 1) to which the French automotive groups had contributed 400 million euros in addition to the 200 million euros by the FSI, it invested with the Fund for the Modernisation of Automotive Equipment Manufacturers Rank 2 (FMEA Rank 2) in several supplier companies to the automotive industry.

As part of the automotive support plan launched by the State in May 2020 to help the sector restructure and face the economic crisis linked to COVID, two main areas of funding have been announced. The first, the Future Automobile Fund 2, increased to 600 million euros, is dedicated to subcontractors in the continuity of the FMEA. Its purpose is to provide new investment capacities, in equity and quasi-equity, to help French subcontractors cope with the crisis and accelerate their capacity for innovation in key automotive technologies. of the future, connected and carbon-free. The second
major mechanism is the Call for Expression of Interest, which is part of the fourth Investments for the Future Program (PIA4) and will benefit projects selected under CORAM. The financial assistance provided to the projects will depend on the size of the companies and will consist of a grant part and a repayable part.

Previously, the automotive industry had already benefited from other investment programs for the future, including a project that led to the creation in 2014 of an Institute for Energy Transition (ITE) dedicated to individual, carbonfree and sustainable mobility. The VEDECOM institute «Communicating Low-carbon Vehicle and its Mobility», based in the Paris region, aims to become the benchmark for the new ecomobility sector on the themes of electrification, the autonomous and connected vehicle and the new mobility solutions and shared energy. It has been supported by NextMove competitiveness cluster (Mov'eo) since 2010 and belongs to the "Autonomous Vehicle Plan". It brings together around 50 members and partners: major industrial groups including PSA and Renault, SMEs, research centers and laboratories, schools and training centers and local authorities. The budget

## is approximately 30 million euros per year.

French car manufacturers are also stakeholders in the Jules Verne Institute for Technological Research (IRT), based in Nantes. Created in 2012 as part of the PIA, its mission is to accelerate innovation and technology transfer to factories in 4 strategic industrial sectors linked to transport, including the automotive industry. Since its existence, 96 projects have been carried out for 203 million euros. In the automotive industry, his work focuses on the development of manufacturing processes for multi-material parts (compositemetallic) and robotic solutions to develop the factory of the future.

In addition, ADEME offers a system for accelerating the development of high-performance innovation ecosystems (transport and sustainable mobility) which results in subsidies and recoverable advances on projects in the R\&D phases, up to demonstration.

# RESEARCH AND DEVELOPMENT EXPENDITURE IN THE AUTOMOTIVE SECTOR 

## 6.9 billion culros <br> Amount of internal and external expenditure on research and development of the automotive sector in 2019

In 2019, the automotive industry was the leading branch in terms of Domestic Research and Development Spending (DRDS) within companies in France, ahead of aeronautical and space construction and the pharmaceutical industry. This innovation expenditure amounted to 4.6 billion euros, i.e. $13 \%$ of all companies' DRDS, up 3\% compared to 2018. External Research and Development Spending (ERDS) doubled since 2015 and amounted to 2.2 billion euros in 2019.

The 2009 crisis had significantly limited companies' financial resources, yet domestic research and development (R\&D) spending had only fallen by $2 \%$ in 2009 and 2010, underlining their vital and long-term nature. Since then, they have fluctuated around 4 billion euros and represent around a third of the branch's gross added value.

Manufacturers must invest, not only to satisfy customers and comply with regulatory standards, but also to achieve the objectives related to the energy transition and develop digital technologies for connected and autonomous vehicles and mobility services. Since 2015 , total R\&D expenditure has increased by $25 \%$ and amounted to nearly 7 billion euros in 2019 .

Cumulatively over the last 5 years, the sector
has thus spent more than 21.6 billion euros on innovation, which also has a knock-on effect on its suppliers, such as plastics, electronics, etc. The automotive is also the sector that files the largest number of patents and the manufacturers PSA and Renault are still in the list of patent applicants.

In Europe, the automotive sector is also the sector that spends the most on research and development with, according to ACEA figures, 62 billion euros spent in 2019, or 33\% of total R\&D expenditure.

AUTOMOTIVE INDUSTRY RESEARCH AND DEVELOPMENT SPENDING

Source: Ministry of Higher Education, Research and Innovation (MESR DGESIP-DGRI SIES)

The Office of Statistical Studies on Research (Ministry of Higher Education, Research and Innovation) conducts surveys on R\&D expenditure carried out by companies and the wider public sphere. From 2008, the data are disseminated in a new classification of economic activity. The total R\&D budget is broken down into domestic spending (DRDS), which corresponds to work carried out in France, regardless of the origin of the funds, and external spending (ERDS), corresponding to R\&D work entrusted to
other companies or to public research organisations; some of the latter expenses may be incurred abroad.

In 2017, 17\% of DRDS in the automotive branch carried out by subsidiaries was due to subsidiaries of groups under foreign control (more than $50 \%$ of the capital).

In 2019, companies in the automotive sector based in France employed 30,700 full-time equivalent people in

R\&D (including 20,100 researchers). These numbers fell by $7 \%$ compared to 2003, but the number of researchers increased by $46 \%$ over the same period.

According to the National Institute of Industrial Property (INPI), the PSA and Renault groups are still in the top five places in the list of patent applicants in 2020. Of the top ten patent applicants, half are companies in the automotive sector.

## AUTOMOTIVE COMPETITIVENESS CLUSTERS IN FRANCE

Initiated by the State and local authorities in 2005, the competitiveness clusters bring together companies (large groups and SMEs/ETIs), research units and training centres in a logic of collaborative projects. Companies can belong to several centres with different specialties in order to obtain know-how (example: software skills for the autonomous vehicle). The clusters also offer many services: economic intelligence, assistance with filing patents, networking, etc.

Their role is to be a lever for the competitiveness of the French economy by emphasising its capacity for innovation and encouraging anchoring and structuring in their territories. Several studies have also shown their impact on corporate R\&D expenditure: one euro of public subsidy received under this policy would have generated an average of 2.5 euros in additional R\&D expenditure by the beneficiary SMEs.

Phase IV of the clusters policy was launched in 2019, with a requirement for excellence and a reinforced European ambition. The objectives of phase III are maintained (action centred on the products and services to be industrialised, consideration of economic outlets and employment) but from now on, they must be more closely integrated into the European networks of innovation, where the importance of their size and their interest in merging and getting closer to other structures.

There are four automotive competitiveness clusters. They have developed their areas of work around innovation, skills, networking and the marketing of new solutions. They are associate members of the structure of the automotive sector: the PFA, Automotive Industry \& Mobilities. In 2019, they joined forces to form the "auto and mobility" inter-cluster, a benchmark in Europe and
internationally.

In 2020, in the particular context of the health crisis, the clusters continued to ensure the link in terms of research and development between manufacturers, equipment manufacturers, innovative SMEs/ETIs, research laboratories, training organisations and territories, through the organisation of events and webinars.

## 1,700 <br> Member establishments of automotive competitiveness clusters in 2020

Sources: DGE (annual survey with the clusters in 2015), Mov'eo, Véhicule of the futur, CARA, ID4CAR

Mov'eo cluster (Nextmove since January 1, 2021) covers the Île-de-France and Normandy regions. In 2019, the cluster merged with ARIA Normandie and the Automobility \& Vehicles Network in Île-de-France (RAVI) to create the «Mobility Valley», a territory of European excellence where are invented, developed, tested and industrialised solutions to meet the mobility challenges of the future. The 4 innovation drivers are: mobility with a low environmental footprint, safe, autonomous and connected mobility, new mobility services and solutions, industrial and operational excellence.

Vehicle of the Future cluster, historically established in Alsace and Franche-Comté, now extends over the entire territory of the Grand Est and Bourgogne-Franche-Comté cluster. In June 2020, the Vehicle of the Future Cluster completed the merger-absorption of ARIA ChampagneArdenne and Lorraine, ARIA PerfoEST having already joined the Cluster in 2008. The cluster supports companies in new mobility markets (electric vehicles, hydrogen, autonomous \& connected and mobility services) and towards the industry of the future (transformation of the production process) with the mission of stimulating innovation, improving business performance, supporting the upskilling of teams and supporting companies in their development and growth.

The ambition of CARA cluster is to support changes in passenger and goods transport systems in the Auvergne-Rhône-Alpes region. It supports 6 sectors: industrial vehicles, automobiles, cable transport, river transport, active and sustainable mobility and rail. CARA implements collective actions: research and innovation projects, real-life demonstrators, actions for the economic and industrial development of its members. The activity revolves around five research programs: motorisation and driveline, safety and security, vehicle architecture, intelligent transport system, mobility, practices and governance. In this new phase, CARA aims to emphasise the experimentation, in real conditions, of innovation projects with the territories, and to accelerate support for European projects.

Located in the west of France (Brittany, Pays de la Loire), iD4CAR cluster focuses on specific vehicles and sustainable mobility. The four strategic business areas are: vehicle materials and architecture, on-board systems intelligence, vehicles (usages and industrialisation) and digital mobility services and infrastructure. The cluster has also played the role of an ARIA on its geographical perimeter since the beginning of 2017. As part of phase IV of the competitiveness
clusters, ID4CAR is extending its territory of actions by developing in New Aquitaine, in order to strengthen the hub Great West Territory.

Clusters other than those specialising in the automobile may have outlets in this sector. These poles work on materials, rubber, plastic, mechanics or mobility. Polymeris, a new Rubbers, Plastics and Composites competitiveness cluster was born from the merger in 2020 of Elastopôle, dedicated to rubber and polymers, and Plastipolis, dedicated to plastics processing, both anchored in the Auvergne-Rhône-Alpes and Centre-Val-deLoire. Its two main strategic axes are the industry of the future and the circular economy. Rooted in the Hauts-de-France region, i -TRANS is the transport, mobility and logistics competitiveness cluster. Its action focuses on six priority sectors, including automotive equipment. In 2015, 13\% of the employees of member establishments of this cluster worked for the automotive industry.

## FRENCH AUTOMOTIUE FOREIGN TRADE

In 2020, trade and global demand addressed to France are impacted by the health crisis and travel restrictions. At national level, exports fell by 15.9\% and imports by $13 \%$.

In this context, exports of automotive products from France fell by $18.5 \%$ in 2020 to stand at 41 billion euros. This decline is largely due to the sharp contraction in exports of new passenger cars (-23.5\%), while exports of parts and engines fell less sharply (-12.2\%). The automotive sector nevertheless remains the $2^{\text {nd }}$ largest exporter with $9.7 \%$ of total exports, behind the food industry and ahead of aeronautics.

On the import side, they fell by $10.5 \%$ for new vehicles and by $22.5 \%$ for parts and engines. Imports of new
passenger cars fell less sharply (-8.3\%) than those of light commercial vehicles ( $-14.5 \%$ ) and industrial vehicles (-21.1\%). After two years with a deficit, the balance of the «parts and engines» item is again in surplus, going from -2.3 billion euros in 2019 to +306 million in 2020. Finally, the balance of trade in new light commercial vehicles remains in surplus, as the previous years.

Overall, the balance of the industrial automobile branch recovered slightly in 2020 to stand at -€14.8 billion (compared to $€ 15.1$ billion in 2019).

The year 2020 was also marked by the withdrawal of the United Kingdom from the European Union on January 31. In 2020, France's balance with the

United Kingdom remained in surplus (+1.2 billion euros) but decreased by $0.2 \%$ compared to 2019. In value, vehicle exports fell more sharply than imports, especially those of new cars.

Exports from the automotive industry amounted to more than 50 billion euros in the mid-2000s, before falling to 34 billion in 2009 with the crisis. They remained within a range of between 39 and 45 billion euros until 2013, then grew to reach 51 billion in 2018. The year 2019, however, marks a turning point with a decline of $2.1 \%$, which is accentuated with the health crisis (-18.7\%). In 2020, exports mainly fell in the 2nd quarter before rising again from the third quarter with the resumption of activity, the recovery plan and the purchase aids put in place by several European States after confinement (Germany, Spain, United Kingdom, Italy).

After 2009, exports of passenger cars varied between 13 and 16 billion, following, in particular, the weakness of the markets of Southern Europe where French groups have a strong presence. Then, from 2016, exports returned to strong growth thanks to the dynamism of the European market. They reached 20 billion euros in 2018 but fell back to 15.2 billion euros in 2020. In addition, the difficulties of competitiveness have modified the structure of production in France, which is moving towards cars with higher added value, to the detriment of those of lower range.

After a sharp drop in 2009, exports of light commercial vehicles grew to reach the record level of 5.1 billion in 2019, thanks to the production of new vans in France and the development of production by French groups for partners. In 2020, they fall by $19 \%$, but the balance remains positive with the sharper fall in imports. Exports of heavy trucks also fell in 2020, after a record level of 4.7 billion euros in 2019.

## FRENCH AUTOMOTIUE FOREIGN TRADE

The main customers of the French automotive industry are generally European. In 2020, five Western European countries alone represent 64\% of the exports of the industrial automobile branch. Among the top 10 customers of French automobile exports, there are also emerging countries in Eastern Europe.

For new passenger cars, the outlets are essentially the four main markets of the European Union (Germany, Spain, Italy, Belgium) and the United Kingdom. In 2020, Germany remains the main importing country, with exports valued at 4.1 billion euros, up $12 \%$ compared to 2019. In other countries, exports are down: $-30 \%$ in Belgium which remains in second place, followed by Italy ( $-32 \%$ ), Spain ( $-45 \%$ ) and the United Kingdom ( $-39 \%$ ), whose export value is slightly less than 1 million euros. Turkey comes in sixth place with almost 500 million euros of cars exported.

Light commercial vehicles will remain mainly exported to these same five countries in 2020. Germany is in
the lead with 1.2 billion euros, a very slight drop of 2\% compared to last year, ahead of Belgium (597 million euros, $-21 \%$ ) and the United Kingdom ( 367 million euros, $-36 \%)$. Poland is in sixth place with 215 million euros ahead of China (109 million euros). In 2020, the amount of exports fell by $19 \%$ and stood at 4.2 billion euros, i.e. 1 billion less than the record level of 2019.

Exports of heavy trucks and coaches and buses, which had increased by 102\% between 2010 and 2019, fell by $24 \%$ in 2020. Exports to Germany remained stable and those to Spain and the United Kingdom fell of, respectively, $-25 \%$ and $-17 \%$.

Finally, the top five export destinations for parts and engines are also European. Germany leads with 3.8 billion euros ( $-10 \%$ ), followed by Spain ( $-17 \%$ ). To the United Kingdom, the third destination country, exports fell by $10 \%$ as in 2019 and 2018, Finally, exports to Italy increased sharply between 2010 and 2018 (+56\%) but fell in 2020 (-9\%).

On the import side, there is a greater diversity of supplier countries: Western Europe, mainly, but also Eastern Europe (including Turkey) and Japan. For light vehicles, Spain becomes the leading supplier (7.4 billion euros) ahead of Germany ( 5.6 billion euros). The United Kingdom, which was a major supplier in 2019, saw its exports decrease and settle at 1.1 billion euros $(-34 \%)$ placing it in twelfth place. Turkey (1.8 billion euros) and Japan (1.2 billion euros) are also important suppliers. For heavy trucks, Germany is in the lead with imports from this country amounting to 1.6 billion euros.

- LEADING DESTINATIONS OF AUTOMOTIVE EXPORTS FROM FRANCE

# PASSENGER CARS BY ENERGY 

Sales of new passenger cars equipped with a diesel engine continued to decline in 2020 (-33\% in volume and -4 points of market share) and represented $31 \%$ of the market (compared to $73 \%$ in 2012). In addition, for the first time since 2012, sales of petrol cars are down $(-39 \%)$ and their market share is falling sharply, from $58 \%$ in 2019 to $48 \%$ in 2020, i.e. a drop of 10 points in 1 year.

This break is explained by the strong growth in registrations of alternative energy cars in a sharply declining automotive market in 2020 (-25\%). It also announces the decline of combustion engines, which should continue with the objectives set by the European Union to reduce $\mathrm{CO}_{2}$ emissions from new cars to
zero by 2035, and the establishment of low emission zones. The petrol car market is all the more impacted in the short term as it still remains dominant in 2020 and concerns models that will be able to benefit from alternative engines. Conversely, the diesel car market has already contracted sharply over the past ten years to refocus on the most relevant models.

Sales of alternative energy cars (electric and hybrid) increased by $111 \%$ compared to 2019 and represented $21.5 \%$ of market share against $7.6 \%$ last year. The segment that has grown the most is that of plug-in hybrids, which volumes have tripled and which market share reached $4.5 \%$ in 2020 , compared to $0.8 \%$ in 2019.

At the fleet level, diesel remains dominant with 57\% of cars in circulation, but it has been falling steadily since 2015. The number of petrol cars in use (40\%) has been growing since 2015 at a slower pace. As for the fleet of alternative energy cars, it emerges with $2.7 \%$ of the total.

Sources: CCFA, MTE/SDES (Ministry of Ecological Transition)

In 2020, France is now at the second place on the European market for new diesel passenger cars, with 504,120 registrations, behind Germany ( 820,000 units) and ahead of Italy ( 452,000 units). The diesel engine is favoured by users making significant annual mileages. Diesel market shares are around 20 points higher in registrations of "non-individual" customers ( $41 \%$ ) than in purchases by individuals (19\%). These figures are also observed in most Western European countries. Conversely, individuals continued to favour petrol vehicles in 2020, which market share is $58 \%$ compared to $37 \%$ for non-individuals.

With regard to alternative energies, registrations of new hybrid passenger cars amounted to 243,675 units, an increase of $94 \%$ (+301\% for plug-in hybrids). Those of new electric passenger cars grew by 159\%, to reach 110,917 units, which places the French market in second place among European markets behind that of Germany.

At the level of the fleet in France, 57\% of cars in circulation on January 1, 2021 were equipped with a diesel engine. This ratio has fallen by more than 6 points since the high point in 2015 . The share of petrol
cars in the fleet has been growing since 2015 and now represents $40 \%$ of the total ( $35 \%$ in 2015 and 64\% in 2000). Alternative energy vehicles represent $2.7 \%$ of the total fleet. Electric cars represent only $0.6 \% ~(+0.3$ point), non-rechargeable hybrid cars $1.7 \%$ (+0.4 point) and plug-in hybrid cars $0.4 \%$ (+0.2 point).

The year 2020 was marked by a sharp increase in new passenger cars powered by alternative energies (electric and hybrid). Registrations of electric and hydrogen cars have increased by $160 \%$, those of plug-in hybrid cars by $300 \%$ and those of nonrechargeable hybrid cars by $58 \%$.

This growth was driven by the strengthening of the car bonus and the conversion premium, as well as by the diversification of the manufacturers' offer. These measures aim to meet the objectives set by the European Green Pact to reduce $\mathrm{CO}_{2}$ emissions

from new cars. By 2030, the target would be to reduce these emissions by $55 \%$ to arrive, in 2035, at the end of the sale of cars with internal combustion engines. The State, with the automotive sector, has undertaken to implement strong measures to stimulate the market for electrified vehicles. Concerning the deployment of infrastructures, the Advenir program was renewed within the framework of France Relance. These measures, together with the development of low-emission zones, are stimulating demand for electric vehicles among individuals.

EVOLUTION OF THE ELECTRIC AND PLUG-IN HYBRID VEHICLES IN USE AND NUMBER OF PUBLIC CHARGING POINTS

- ELECTRIC AND PLUG-IN HYbRID VEHICLES IN USE (LEFT SCALE)
- NUMBER OF PUBLIC CHARGING POINTS

Source: AVERE, MTE/SDES (Ministry of Ecological Transition)

As part of the support plan for the automotive sector presented in May 2020 by the President of the Republic, the amounts of the ecological bonuses and the conversion premium have been revised upwards and extended to a greater number of households. These cumulative devices, with a maximum of 12,000 euros, vary according to the type of vehicle purchased, as well as the reference income of the buyer. In 2020, the ecological bonus was between 2000 and 7000 euros. Slightly lowered from the beginning of August 2020, the conversion premium was between 1,500 and 5,000 euros. In addition, an exceptional bonus on more advantageous terms was granted to 200,000 households between June and August 2020 for the purchase of a new or used vehicle.

Regarding charging infrastructure, the public authorities have undertaken, through the Strategic Contract for the Automotive Sector, to increase the number of charging points to 100,000 by the end of 2021. This equipment is essential for the development of electrified vehicles whose autonomy is limited and the recharging time sometimes long. At the end of 2020, according to AVERE, there were 31,200 public charging points in France for 402,309 electric and plug-in hybrid cars, i.e. 1 point for 13 vehicles. To develop private charging points, the

Advenir program, created in 2016, was renewed at the end of 2019 with a budget of 100 million euros. The objective is to deploy more than 45,000 new charging points in businesses and condominiums by the end of 2023. According to the SOFRES survey, only $7 \%$ of users have a terminal at their home and $10 \%$ at their place of work. The government has also provided a 100 million euros budget to finance fast charging stations on motorways and the national road network (500 stations equipped with at least 4 terminals with a power of 150 kW each). At the same time, several players in the automotive, energy and retail sectors have committed, through the signing of the "Objective 100,000 terminals" charter, to participating in the deployment of charging points open to the public.

Car manufacturers are offering an increasing number of electric and hybrid models. In 2020, in France, nearly 50 different models of electric cars have already been sold, with Renault and Peugeot dominating the market. Renault almost doubled sales of the ZOE in 2020 ( $34 \%$ of the market) and Peugeot's 208 represented $15 \%$ of the electric car market. In the plug-in hybrid market, Peugeot and Renault dominate the market, with the 3008 representing $9 \%$ of sales and the Captur (7\% of sales). This movement will accelerate because the
two groups have committed to heavy investments to electrify their entire range.

On the buyer side, the main obstacle to the purchase of an electrified vehicle remains the cost of the vehicle, followed by the lack of autonomy and then the lack of charging stations. $65 \%$ of respondents consider financial support measures (bonus/penalty/premium) as the first factor impacting their purchasing decision. Similarly, traffic restrictions for polluting vehicles influence purchase intentions, particularly in large cities. Finally, for companies, taxation can be a support tool for the development of electrified vehicles (TVS, depreciation ceiling, etc.). Today, 54\% of registrations are made by non-individuals, but on the plug-in hybrid market, non-individuals represent $73 \%$ of registrations. On the other hand, for electricity, buyers are mainly individuals (54\%).

## new Car registrations by model, rance and body type

The economy and lower range is predominant in France with 59\% market share in 2020 (compared to $42 \%$ in Western Europe). The 10 best-selling models in France belong to this segment. After reaching its peak in 2010 thanks to the bonus/ malus system and the scrapping scheme, the economy and lower range fell in 2011-2012. Then, the renewal of cars in the economy range (108, C1, Twingo, ZOE), the success of sales of models in the existing lower range (208, C3, Clio, Sandero) and the development of the product offer in SUV on this range (C4 Cactus, 2008, Captur, Duster) once again boosted the segment, which stabilised at around 53\% market share until 2017. Since 2018, its market share has strongly increased

- RANKING OF THE MAIN MODELS OF NEW PASSENGER CARS IN 2020

again (+6 points) to reach 59\% (+3 points compared to 2019). The development of models or versions with alternative engines, whether for the nonrechargeable hybrid (Clio), the plug-in hybrid (3008, Captur) or the electric (ZOE, 208, DS3 Crossback), has once again expanded the offer.

Sales by body type show that 4WD and SUV vehicles have continued their strong growth (+30 points of market share since 2010) thanks to the offer in the lower ranges (Captur, 2008, Duster) and lower average (C3 Aircross, C5 Aircross, 3008, 5008, Kadjar) and represent, in 2020, 39.5\% of sales (+1.2 point compared to 2019). Sedans, down sharply (from $72 \%$ in 2000 to $51 \%$ in 2015),
represent half of sales in 2020, slightly up on last year (+0.4 point). Finally, over the same 2010-2020 period, the share of minivans (-14.3 points to $5.1 \%$ ), station wagons ( -3.2 points to $4.0 \%$ ) and coupé cabriolets ( -2.3 points to $0.7 \%$ ) fell.

## USED PASSENGER CARS

Second-hand passenger car registrations amounted to 5.5 million units in 2020 , a decline of $3.8 \%$, which remains weak, compared to the collapse of new car registrations ( $-25 \%$ ). The ratio between the number of used cars and that of new cars therefore jumped in 2020, from 2.6 in 2019 to almost 3.5 used cars sold for every new car.

According to the Parc Auto survey (page 47), the length of vehicle ownership increased slightly in 2020. Households keep their vehicle for an average of 5.6 years compared to five years in 2010 and four years in 1995.

The share of used car registrations less than five years old remained stable in 2020 (37\%), except for the category of less than one year old, which fell by 1 point to $9 \%$. Within the registrations of used cars over ten years old, the category over fifteen years old increased by 2 points, from 19\% in 2019 to $21 \%$ in 2020.

Diesel cars remain dominant in second-hand registrations with 3.2 million units sold, but their share continues to decline, falling from 61\% in 2019 to $57 \%$ in 2020. The continued implementation of low emission zones, more unfavourable to diesel vehicles, continues to weigh on sales. Conversely,
alternative engines benefit from these measures, as well as purchase support schemes (bonus, conversion premium) which stimulate both the new market and the second-hand market. In 2020, registrations of used electric and hybrid cars increased by $46 \%$ and $40 \%$ respectively. Together, this category now represents $2.6 \%$ of the secondhand market, compared to $1.8 \%$ in 2019

Sources: CCFA, MTE/SDES

The private car is a durable good that the household buys, uses, maintains and possibly resells on the second-hand market.

These second-hand car sales are made through car dealers or directly between individuals. Professionals generally handle "young" secondhand car transactions, that is to say less than 5 years old. It is estimated that about $60 \%$ of second-hand transactions are carried out through a professional, the rest being transactions between individuals. But in 2020, according to the Parc Auto survey, sales channels between individuals would have declined in favor of second-hand dealer networks, which are undoubtedly more reassuring in terms of health.

Between 5 and 6 million used cars are exchanged per year and this market is subject to less fluctuation than that of new ones. The demand for used vehicles is generally closer to the evolution of the fleet; it is less influenced by economic factors than the demand for new cars. It may nevertheless be affected by measures to stimulate the new home market (bonus/ malus system, conversion premium, etc.). In addition, in 2020, it suffered the shock of the health crisis, but to
a lesser extent than the new one, like what happened between 2009 and 2013.

The aging of the fleet and the development of multi-motorisation of households have resulted in an increase in the share of cars over 5 years old in second-hand transactions between 1990 and 2016 ( $68 \%$ in 2016 , against $48 \%$ in 1990). But, over the past three years, incentives to renew the fleet have increased the share of used cars less than 5 years old and reduced that of the oldest vehicles. Indeed, the market share of used cars aged 15 and over, which had more than doubled since the beginning of the 2000s, particularly after the crisis, fell slightly in 2018 and 2019. In 2020, on the other hand, it increased to again by 2 points to reach $21 \%$.

Used cars less than a year old can be compared to the new market. Indeed, these are often cars first registered by an automotive sector professional (demonstration car or rental car), then sold to individuals. From 2001 to 2009, the share of less than 1 year old in all registrations of second-hand passenger cars steadily decreased, before evolving around 8\% between 2010-2016 (12\% in 2001).

During the years of the scrapping bonus, the prices of new cars were indeed more competitive. Since then, volumes have increased each year, reaching 593,243 registrations in 2019. But in 2020, automotive professionals affected by the health crisis reduced their purchases, and the share of cars less than 1 year old fell by 1 point to stand at $9 \%$ of second-hand car registrations.

The share of diesel in used cars fell to $57 \%$ in 2020 , a decline of 10 points since 2015, thus reflecting the developments observed in the new market.

In 2020, according to the Parc Auto survey (Kantar TNS), $59 \%$ of cars owned or made available to households were purchased second-hand, compared to $51 \%$ in 1991. With regard to cars acquired in 2020, this share was 69\%.

## REGISTRATIONS OF NEW VEHICLES IN FRENCH OVERSEAS DEPARTMENTS [DOM]

Sales of new vehicles in the five overseas departments fell by $19 \%$ in 2020 , i.e. a slightly less steep decline than that observed in metropolitan France (-24\%). As in metropolitan France, the decline is more marked for passenger cars (-20\%) than for light commercial vehicles ( $-14 \%$ ). Guadeloupe and Martinique are the departments most affected $(-25 \%)$, while in the others, the declines ranged between $-16 \%$ and $-6 \%$.

As in metropolitan France, the share of diesel cars continues to decline and now stands at $27 \%$ of registrations, down 2 points compared to 2019 (compared to $64 \%$ in 2012). The share of electric cars remains low ( $3 \%$ of registrations), except in Reunion where it reached $4.4 \%$ in 2020, compared to $6.7 \%$ in metropolitan France. For plug-in hybrid vehicles, it is $1.3 \%$ compared to $4.5 \%$ in metropolitan France.

Sales of light commercial vehicles fell by $14 \%$ on average in 2020, after an initial decline of $10 \%$ in 2019.

Their share of all sales thus fell to $16 \%$, compared to 19\% in metropolitan France.

Registrations of commercial vehicles over 5 tonnes held up better in 2020. Registrations of heavy goods vehicles fell by only $8 \%$ and those of coaches and buses even increased by $15 \%$ in 2020, thanks in particular to Réunion $(+31 \%)$. Nevertheless, their share in all registrations remains lower ( $1.4 \%$ ) than in metropolitan France $(2.3 \%)$, given the geographical context.

The share of French groups in the passenger car market has increased to $53 \%$ in 2020. In the light commercial vehicle market, the share of French groups has gained nearly 5 points, rising from $57 \%$ in 2018 to $62 \%$ in 2020 , which remains slightly lower than in metropolitan France (about two-thirds of the market). In the narrow industrial vehicle market, Renault Trucks' market share remains at $26 \%$ in 2020.

In the context of the health crisis, registrations of used passenger cars held up better than the new market. They only fell by $1 \%$ to 126,436 units, i.e. a ratio of 2.4 cars sold used for 1 car sold new against 1.9 in 2019.

On January 1,2021 , the fleet of passenger cars in the overseas departments was 870,761 units according to new estimates from the services of the Ministry for Ecological Transition.

NEW PASSENGER CAR REGISTRATIONS IN FRENCH OVERSEAS DEPARTMENTS AND USED/NEW RATIO

FRENCH MANUFACTURER MARKET SHARE IN FRENCH OVERSEAS DEPARTMENTS (NEW PASSENGER CARS)

FRENCH MANUFACTURER MARKET SHARE IN FRENCH OVERSEAS DEPARTMENTS (LIGHT COMMERCIAL VEHICLES)
As a \% of the total market

In 2020, registrations of new light commercial vehicles fell by $16 \%$ (after $+4.5 \%$ in 2019) and reached a level of 402,382 units, close to that observed in 2015-2016. The fall in commercial vehicle registrations, during this year marked by the health crisis, was nevertheless less significant than that of passenger cars, which reached $-25 \%$.

The share of diesel vehicles remains stable compared to 2019 at 93\% (-4 points compared to 2015). The share of electric vehicles reached $2.2 \%$ in 2020, up 0.5 point compared to 2019 , with 8,780 units sold. French manufacturers are asserting their presence in this electric vehicle segment with a

78\% market share, 3 points more than last year, compared to $66 \%$ for all energies combined.

The number of new light commercial vehicles in use, estimated at 5.9 million units as of January 1, 2021, is still largely dominated by diesel engines, which represent $95 \%$ of vehicles. The fleet of electric light commercial vehicles, although small (48,500 units as of January 1, 2021), increased by $18 \%$ compared to last year. The fleet, all energies combined, is made up of more than $50 \%$ of vehicles from 2.6 tonnes to 3.5 tonnes

- LIGHT COMMERCIAL VEHICLES REGISTRATIONS BY ENERGY

Light commercial vehicles are defined as vehicles of less than 5 tonnes of gross vehicle weight, intended for the transport of goods. In many sectors (agriculture, construction, services, etc.), they are also used to come and go to the workplace, for transfers between sites, for the transport of equipment. They come in different categories: utility derivatives of passenger cars, combispaces, vans, vans, pick-ups and 4WD and SUV.

These vehicles are intensely used vehicles: they cover more kilometres each year ( 2,000 more on average) than private cars (see the traffic report on page 50). While individuals travel fewer kilometres with their light commercial vehicle, certain sectors are very intensive users: transport, courier, warehousing, as well as specialised activities and the manufacturing industry. These vehicles are mainly used in urban areas or on the road (excluding motorways).

In 2020, van sales, in volume, are down for the first time since 2014 (-12\% compared to 2019).

Nevertheless, they are growing in market share and represent $46 \%$ of sales of light commercial vehicles ( $44 \%$ in 2019). The second segment is that of vans, which represent just under a quarter of sales, a share slightly down on 2019 (-1 point). Sales of pick-ups, which experienced strong growth between 2015 and 2018 (+75\%), collapsed with the introduction in 2019 of the penalty and the TVS for this category of vehicle. Their decline intensified in 2020 with a 38\% drop in registrations for a volume of 9,468 units. Finally, utility derivatives of passenger cars represent only $13.6 \%$ of sales in 2020 compared to $32 \%$ in 2000.

Light commercial vehicles from 2.5 to 3.5 tonnes have been the majority since 2016 in new registrations; their share will reach $60 \%$ of sales in $2020(+25$ points since 2001), while that of 1.5 to 2.5 tonne vehicles has fallen from $59 \%$ to $39 \%$ over the same period. Since 2010, sales of vehicles from 2.5 to 3.5 tonnes have increased by $34 \%$, while sales of all other categories have declined.

In 2020, registrations of used light commercial vehicles fell by $2.2 \%$ compared to 2019, but with 800,000 units, they are at a high level. Since 2000, the number of used commercial vehicles has tripled. For the first time since 2016, the used/ new ratio is greater than 2.

Nearly 10\% of new registrations of new commercial vehicles are made by private individuals, who favour vans and vans in their purchases as well as pick-ups. As of January 1, 2021, 47\% of the portfolio is owned by natural persons (individuals and artisans), $14 \%$ by legal persons operating in the construction sector and $8 \%$ in the trade sector.

## CHARACTERISTICS OF NEW LICHT COMMERCIAL VEHICLES IN FRANCE

French groups are traditionally more present on the light commercial vehicle market than on the passenger car market. With the opening of markets in Europe, as for passenger cars, their market share has decreased in France, but has increased among our European neighbours. In 2020, sales by French groups represented 65.3\% of the total market for light commercial vehicles in France, down 0.8 point compared to 2019, but at a lower level of 4.5 points compared to 2005. In Europe excluding France, their market share is significant and is consolidating from year to year, rising from $24 \%$ in 2011 to $32.7 \%$ in 2020.

The French groups are reference manufacturers and produce on their sites also for their partners (Renault for Nissan, Daimler and Mitsubishi; and PSA for Toyota and Fiat following the creation of Stellantis). Production in France, entirely carried out by French groups, represents $2 \%$ of world production, a stable share despite the crisis, i.e. 390,000 units in 2020, including 47,300 units for partners (i.e. 12\% of their production in France).

MARKET SHARE OF FRENCH LIGHT COMMERCIAL VEHICLES ON THE FRENCH MARKET

- RANKING OF MAJOR NEW LIGHT COMMERCIAL VEHICLES IN 2020

| Brand | Model | 2020 | Market share |
| :---: | :---: | :---: | :---: |
| RENAULT | KANGOO | 32,093 | 8.0\% |
| RENAULT | MASTER | 31,762 | 7.9\% |
| RENAULT | TRAFIC | 25,864 | 6.4\% |

Source: CCFA

Thanks to the success of their models (Renault Kangoo, Citroën Berlingo, Peugeot Partner, Renault Master), French groups are particularly present in the van segment ( $83 \%$ of sales in this market) as well as in passenger car derivatives (87\%) (Renault Clio, Peugeot 208). Regarding the largest market, the van segment, competition is more marked: French groups represent $61 \%$, up 5 points since 2010. All segments combined, of the 20 best-selling light commercial vehicle models in France in 2020, 13 are models from French
manufacturers.
Light commercial vehicles are vehicles with higher added value, which can be more easily produced in France. Over the past twenty years, the production of light commercial vehicles by French manufacturers in France has increased from 371,000 units in 2000 to 510,000 in 2019, in line with the growth of the French and European market. It first fluctuated between 300,000 and 400,000 units between 2000 and 2008, then
collapsed to 180,000 units in 2009. Since then, it has more than doubled. In 2020, following the crisis, production fell sharply to 390,000 units, i.e. $24 \%$ less than in 2019 , but remains at a level still higher than that of 2014. It represents $30 \%$ of the total production of light vehicles in France, compared to $16 \%$ in 2013.

# CHARACTERISTICS OF THE HEAVY TRUCKS MARKET IN FRANCE 

The French market for commercial vehicles over 5.1 tonnes fell by $24.4 \%$ in 2020 to 41,730 units. After falling sharply during the 2009-2010 crisis ( $-40 \%$ to 34,000 units), the market recovered slowly but experienced a further decline in 2014 $(-13 \%)$. Then, from that date, it progressed at a high rate (+8\% per year on average, i.e. +50\% in five years) to reach more than 50,000 units in 2019, i.e. a level equivalent to the years before the crisis. In 2020, despite the collapse linked to the health crisis, the number of registrations remains higher than the lows of 2009-2010 and 2014.

The tractor market is down $32 \%$ in 2020 , while that
of rigids is down $15 \%$. Thus, these two markets are at the same volume level at 20,860 units, while that of tractors was historically higher. In 2020, industrial vehicles over 16 tonnes represent 85\% of the market. This share has been increasing steadily for twenty years, from $77 \%$ in 2002 to 87\% in 2019.

Since the end of the 2009-2010 crisis, the used industrial vehicle market has been close in volume to that of new vehicles, with an average ratio of 1.1 used vehicle sold for 1 new vehicle. In 2020, the used vehicle market amounted to 49,800 units, down 7\% compared to 2019.

In 2020, Renault Trucks will retain its leading position in France with a market share of 28.2\% compared to $27.7 \%$ in 2019, an increase of 0.5 point. Its second-hand vehicle market share is 33\%.

RENAULT TRUCKS MARKET SHARE IN FRANCE

Heavy duty vehicles are defined as vehicles of more than 5 tonnes of total authorised weight in load, intended to transport goods. A distinction is made between rigids and tractors. They can be delivered with body or come in the form of stand-alone chassis that are later fitted by specialist manufacturers. Each truck is custom built and is therefore a unique product. The rigid truck is manufactured to receive a container or heavy equipment on its chassis and comes in different categories according to its uses: tipper, van, flatbed, refrigerated, tank. The road tractor is intended to "haul" its trailer and is used more for long-distance transport. Tractors used for long journeys are equipped with many devices to improve driver comfort: sleeping berths, storage, touch screens, audio/radio system and even a refrigerator.

The tractor market, which represents approximately $56 \%$ of the truck market, is more volatile than that of rigid vehicles. More intensely used, towing vehicles are renewed more
frequently. Thus, the fleet of tractors is twice as young as that of rigids with an average age of 5.5 years and 11 years respectively. However, truck tractor sales are also more affected by the vagaries of the economic climate and road freight transport. In 2009, 2014 and 2020, the market for tractors fell 10 points more than that for rigids.

Renault Trucks' market share in France has held steady since 2013 at around 28\% after experiencing higher levels in the 2000s (around $35 \%$ ). In 2020, in a sharply declining market, it increased by 0.5 point to reach $28.2 \%$. On the rigid market, it averages 35\% and exceeds 36\% ( $36.4 \%$ in 2020) in the over 16 tonne segment, which represents $2 / 3$ of the rigid market. In the tractor market, Renault Trucks represents 21.2\% of registrations in 2020. Finally, in the used truck market, Renault Trucks is also the leader with $33.3 \%$ market share in 2020.

The share of alternative energy heavy duty (gas, electric, hybrid) remains very low but nevertheless
reached $3.9 \%$ in 2020 (compared to 1.2\% in 2019) in particular thanks to the development of the natural gas market for vehicles (3, 2\% market share). The offer of electric heavy vehicles has been expanded in recent years to meet environmental requirements in urban areas. Renault Trucks now offers a full range of electric vehicles ranging from 3.1 tonnes to 26 tonnes and meeting the diversity of urban logistics businesses (refrigerated transport, waste collection, distribution). In 2023, a tractor for regional transport and a rigid dedicated to urban construction will complete the range of zero-emission trucks.

In 2020, the household car ownership rate increased slightly again ( +0.2 point) to reach $85.2 \%$, excluding heavy commercial vehicles. Households which own more than one vehicle represented $37 \%$ of all households, compared
to $30 \%$ in 2000, 26\% in 1990 and $16 \%$ in 1980. Households with 3 or more cars represent $5.3 \%$ of all households (see page 93).

94\% of households living in rural areas or periurban areas (rural areas close to towns) own a vehicle.

In the Paris region, a dense area benefiting from a developed public transport network, the proportion of equipped households is lower at 65.6\%; this ratio has not fallen any further in recent years. In other large French cities, the rates remain closer to $80 \%$.
66.4\% of low-income households (less than 15,000 euros per year) are equipped with at least one car compared to 62\% in 2015.
$85.2 \%$ of households aged between 65 and 74 and $76 \%$ of those over 75 are motorised ( $75 \%$ in 2017). The possession of a driving license and the share of drivers in this age category continue to increase steadily.

The rate of possession of a driving license among individuals aged under 25 has not declined: it is around 65\% among 18-21-year-olds and around $84 \%$ among 22-25-year-olds. It rises to $90 \%$ for those over 75 .

Sources: INSEE until 1993, KANTAR TNS PARC AUTO since 1994

The car ownership rate is measured by the percentage of households having at least one car. After several years of decline, it has been rising since 2015 (+2.2 points) to stand at $85.2 \%$ in 2020.

It is largely linked to income, the age of the head of household, the socio-professional category, the living areas and the number of people in the household.

- According to INSEE, if, in 2019, the 20\% of the wealthiest households are equipped with at least one car at $91 \%$, the $20 \%$ of the poorest are at $66 \%$; these rates were 89\% and 60\% respectively in 2004 (INSEE, Surveys on living conditions, 2021).
- Car ownership rates in towns with more than 100,000 inhabitants will stabilise at around 84\% in 2020 , compared to $75 \%$ in 1995. In the Paris metropolitan area, the rate will stabilise at around $65.5 \%$, i.e. a decline of 3 points in 25 years. In the Lille and Marseille conurbations, the rates are rising, after falling in 2018, to stand at $84 \%$ and $87 \%$ respectively in 2020; they now exceed their previous levels. Finally,
in the Lyon conurbation, the motorisation rate fell by 7 points compared to last year and stands at $76 \%$.
- Rural households, large families, as well as workers and farmers constitute very multi-motorised categories. Their car ownership rate is on average more than $90 \%$.
- The categories of employees and inactive people (including retirees) are relatively less equipped but, since 2000, their car ownership rate has increased steadily (respectively +4.3 and +10.6 points).

From 2010 to 2020, the proportion of households that have "de-motorised" (among those without a vehicle) has increased steadily, by 2 to 3\% per year. In 2020, the demotorisation rate decreased by one point and stood at $55 \%$. The main cause of non-motorisation remains the absence of a driving license followed by the absence of need, the preference for public transport, cycling or walking, the high cost of use and the difficulties of parking. Among non-motorised households, $14 \%$ of them plan to re-motorise over the
next two years, a stable share compared to last year.

CAR OWNERSHIP BASED ON AREA
OF RESIDENCE

## THE HOUSEHOLD CAR FLEET

After declining steadily from the 2000s, daily car use stabilised at around $72 \%$ until 2018. Then it fell in 2019 and 2020. The share of vehicles in the fleet used daily or almost daily increased fell by 5 points between 2018 and 2020, from 72.5\% to 67.3\%. The proportion of vehicles used for commuting has stabilised at around $52 \%$. In 2020, that of business trips other than home-work journeys amounted to $12.6 \%$, a drop of 2.5 points compared to 2019 in a context of travel restrictions. As for journeys related to education, their share was $22.4 \%$.

The average age of the household fleet and the length of ownership of vehicles tend to increase over the long term. In 2020, the fleet aged slightly compared to last year, it stood at 9 years against 8.9 years in 2019, and the vehicle holding period
was 5.6 years against 5.5 in 2019, 4.4 years in 2000 and 4.1 years in 1995.

The fall in the market share of diesel vehicles in registrations has an impact on the composition of the fleet. The share of diesel in the fleet has been declining for 5 years and reached $52 \%$ in 2020, i.e. two points less than in 2019 and almost ten less than in 2015.

The mileage of a fleet vehicle has fluctuated around 104,000 kilometres since 2005, compared to 70,000 kilometres at the beginning of the 1990s. It has been falling slightly for 5 years and stands at 99,670 kilometres in 2020. The mileage of a diesel car will increase in $2020(129,650 \mathrm{~km})$ in line with the aging of the fleet and will remain $19,000 \mathrm{~km}$ higher than
its 2000 level; that of a petrol car, less intensely used, continues to fall to $67,680 \mathrm{~km}(-15,000 \mathrm{~km}$ since 2000).

## Nearty 1 cars are used every out of 10 day (or almost

Note: Years after 2007 cannot be compared directly with previous years; the scope of light commercial vehicles has been enlarged.
(1) Since 2017, Opel is integrated within PSA group.

Sources: INSEE until 1993, KANTAR TNS PARC AUTO since 1994

The CAR PARK survey, conducted by KANTAR TNS every year, provides a detailed description of the vehicle fleet, owned or made available to households.

This fleet mainly includes passenger cars, but also light commercial vehicles (about 4\% of the total).

The renewal of the petrol fleet continues with an average age which has fallen by two years since 2014 , to reach 8.5 years. The average age of diesel continues to increase and reaches 9.6 years. The weight of vehicles over 5 years old in the fleet has been declining for 2 years and stabilises around $66 \%$ in 2020. This is explained by the decline in the share of $5-10$-year-olds ( -2 points in 3 years), while that of those over 10 years old stabilises at around $33 \%$.

The most common fiscal powers are between 2 and 5 HP . Lower and lower mid-range cars are very popular and their share of the fleet has remained
high compared to higher ranges. In 2020, they represented $49 \%$ and $24 \%$ of the fleet respectively, compared to $7 \%$ for cars in the upper middle range. The share of cars in the miscellaneous range, consisting mainly of 4WD and SUV vehicles, is experiencing strong growth. It stands at $16.7 \%$, more than double their weight in 2015.

The high average age of the fleet implies a low rate of equipment in terms of automatic gearboxes and emergency systems (eCall) even if it is progressing regularly. In 2020, this ratio stood at $16 \%$ (compared to $9 \%$ in 2016) and $9 \%$ (compared to $3 \%$ in 2016) respectively. This share is higher in households owning more than 1 vehicle, respectively $24 \%$ and $13 \%$ for the main car.

Regarding driving frequency, more than $80 \%$ of rural and small town dwellers use their vehicle regularly. In the Paris conurbation, this frequency is only $50 \%$ and tends to decrease in Paris intra muros and the first ring. Conversely, in other
large cities, use is intensifying: nearly 7 out of 10 households regularly use their car in 2020 and 6 out of 10 in the Lyon area.

VEHICLE USE

# DOMESTIC PASSENGER TRANSPORT 

The mobility of people is a social and economic necessity that allows exchanges between people, sources of wealth and job creation.

The private car, but also the light commercial vehicle, provide door-to-door mobility. They respond to multiple individual constraints (elderly people, children, disabled people, transport of heavy or bulky objects) and provide an appropriate response in sparsely populated residential areas,
or when the flows are not high enough (staggered hours) to that public transport is economically and societal relevant.

Expressed in passenger-kilometres and limited to domestic transport, the road is predominant in the movement of people and its share will increase in 2020 with the health crisis: $85 \%$ for private cars (+4 points) and 5\% for buses, coaches and trams (-1 point).

All modes combined, domestic passenger transport will drop drastically in 2020 (-24\%) and stand at 749.4 billion passenger-kilometres.

Mobility in private cars fell by $19 \%$ and is the mode of transport least impacted by travel restrictions. Road public transport will drop by $38 \%$ in 2020, including -33\% for urban public transport and -38\%
for coaches.

Rail transport, after an increase of more than $4 \%$ in 2019 , fell by $42 \%$, including $-42 \%$ for highspeed trains and $-45 \%$ for trains and RER in Île-de-France.

Finally, air transport has been halved (-55\%) and the total number of travellers has reached a historically low level of 54 million, i.e. the lowest number since 1991. Flights between overseas departments are the least impacted ( $-44 \%$ ) while the number of metropolitan passengers on international flights fell by $73 \%$, in connection with border restrictions.

Source: MTE/SDES

The mobility of people is obviously linked to the economy, as for the transport of goods, but it also includes a social dimension, namely the meeting between people, which remains essential.

If the transport of goods is more linked to the productive sphere, whether industrial, artisanal or agricultural, the mobility of people covers a much wider economic field. Home-to-work shuttles constitute an important base, but the development of the economy, including the tertiary sector, is also dependent on the mobility of people (health services, leisure, tourism, etc.).

The determinants of the choice of modes of transport are located in the origin-destination, the distance, the times and the individual constraints (volumes transported, timetables, etc.). The
development of new individual transport services also widens the modal choice.

The transport of people requires, for each mode, significant investments, generally amortised over a long period, to build and maintain the infrastructures.

By expressing mobility in passenger-kilometres, light vehicles appear to be dominant in domestic passenger transport. The expression in number of daily journeys, particularly in dense urban areas where public transport and other modes (bicycles, motorbikes, etc.) play an important role, or in passenger-kilometres for long-distance international journeys, shows the field of relevance of each mode and their complementarity.

Domestic passenger transport, expressed in passenger-kilometres relative to the number of inhabitants, grew steadily between 1990 and 2002 (+1.1\% per year). Then, due in particular to the rise in fuel prices, a plateau seems to have been reached and an average drop of $0.6 \%$ was observed between 2002 and 2013. From 2014, domestic passenger transport per inhabitant increased again, in connection with the increase in individual mobility, but at a low average annual rate $(+0.3 \%)$, then it fell sharply with the 2020 crisis.

## DOMESTIC FREICHT TRANSPORT

The transport of goods is the transmission belt of the economy: it makes it possible to physically connect the places of production of the goods to each other, to the places of consumption, then the latter to the places of reprocessing-recycling. In addition to these geographical dimensions linked to land use planning, there is also the notion of time.

Road freight transport meets many criteria involved in the choice of mode. Its share in the transport of goods remains stable (around 86\% of tonne-kilometres performed) and distances of less than 300 kilometres predominate, making modal shift more difficult: 53\% of tonnes loaded by the French flag are delivered within 50 kilometres in 2018.

Between 2010 and 2015, road freight transport fell by $1.5 \%$ on average annually, in line with the decline in activity for the French flag (-2.6\%/year), while the foreign flag increased by $0.8 \%$ each year. From 2016, the economic recovery fuelled growth, which
accelerated in 2017. Over the period 2015-2019, road freight transport grew by nearly 4\% per year, but the level of activity remained below its level before the 2008 crisis. In 2020, travel restrictions had a strong impact on traffic, but the transport of goods, supported by the trade in basic necessities, only fell by $11 \%$ compared to $24 \%$ for the passenger transport.

Rail freight transport, after falling in 2018 following the strikes, recovered and grew by $1.7 \%$ in 2019. Since the 2009 crisis, it has fluctuated around 33 billion tonne-kilometres, or $60 \%$ its 2000 level and its market share stood at $9 \%$ in 2019 (compared to $16 \%$ in 2000). In 2020, it experienced a drop of $8 \%$, a consequence of the drop in national traffic volumes. As for river transport, after the rebound in 2019 (+10\%), it fell by $11 \%$, mainly during the first confinement.

## DOMESTIC FREIGHT TRANSPORT IN FRANCE

BREAKDOWN OF FREIGHT TRANSPORT USING FRENCH HAULIERS

The demand for freight transport is closely linked to the economy of the country and its interactions with others; it corresponds, on the one hand, to the domestic demand of the various economic actors and, on the other hand, to the exports of companies producing in the country. In addition, certain countries such as Germany or France are, by their geographical position, areas where the transit of goods plays a preponderant role. In the road transport of goods, this is reflected in the cabotage phenomenon but also, for several years, in the arrival of foreign players, who are taking increasing market shares from the French flag.

The physical transfer of freight and goods exported by a country is one of the aspects of the competitiveness of the economy. In order to stand up to competition and facilitate export activity, the social and tax burden weighing on the road mode, whether it is common law or specific (fuel tax), must be close to that in force in other European countries.

The destination and the type of freight or goods exchanged are often discriminating criteria in the choice of mode of transport. Liquids can be transported by pipeline, thus avoiding load breaks; the ports are, among other things, used for trade with distant countries.

The domestic demand of the different economic agents relates to a wide variety of commodities or goods. It is satisfied by national (auto)production, or by imports. Transport makes it possible to physically link the places of production with each
other, then with those of consumption and finally with the places of reprocessing-recycling: in France, the interaction with regional planning is all the more significant.

Due to the wide variety of goods and merchandise, many factors come into play and can condition the choice of mode of transport. It's the case for: - the weight of the goods: car manufacturers mainly have their steel coils transported by rail or river;

- the value of goods and merchandise transported; - delivery time: perishable foodstuffs, such as fresh produce, must be transported quickly and are therefore mainly transported by road;
- the place of departure and arrival of the goods, both during the production phase (link with land use planning) and during the consumption phase. The latter is mainly located in urban areas, due to the places of residence of households.

In addition, the different modes of transport require infrastructure, which is synonymous with significant investments, generally amortised over a long period, and which must be used wisely. Intensive use, i.e. a massification of flows, is all the more relevant. The same applies if, during a transport chain, several modes are used, in particular due to load breaks between these different modes.

Road freight transport, through its ability to irrigate the capillarity of the road network, its flexibility, its adaptability and its quality of service, meets these numerous criteria, which show that transport is not a homogeneous whole, but a multitude of sub-
markets, which are often not substitutable. Also, modal shift is not possible for a large part of the flows, especially in the last kilometres, or because it would increase transport distances too much. Freight intermodality is based on an economically acceptable cost and efficient changes in modes of transport.

Without taking into account the geographical location of the places of departure and arrival, there are two main units for measuring the freight transport: the tonne measured during loading and tonne-kilometres. The road remains preponderant in the freight transport, with a modal share of $86 \%$ of the tonne-kilometres carried out. The Transport Routier de Marchandises (TRM) survey by the Ministry of Transport shows the predominance of distances of less than 300 kilometres: 49\% of tonnes transported by the French flag are transported at a distance of less than 50 kilometres and $53 \%$ of tonne-kilometres within 300 kilometres.

## ROAD TRAFFIC

Although road traffic, expressed in billions of vehiclekilometres, increased on average by more than $2 \%$ per year between 1990 and 2002, its growth slowed markedly between 2002 and 2012 (+0.6\%/year). Then it accelerated again until 2017. Since then, according to the latest data from the Ministry of Energy Transition, road traffic has not progressed. It stagnated in 2018, then fell in 2019 (-0.8\%) and finally collapsed in 2020 (-16.9\%) following travel restrictions.

Traffic is mainly carried out by light vehicles, which represent $92 \%$ of total traffic. In 2018 and 2019, the circulation of private cars under the French flag fell by
around $0.3 \%$ each year. This is explained both by the drop in the average journey per vehicle, but also by the stability of the fleet of passenger cars. In 2020, the successive confinements as well as the development of teleworking had a major impact on the journeys of private cars, the circulation of which fell by $17.7 \%$.

The circulation of light commercial vehicles registered in France was less impacted by travel restrictions and fell by $8.4 \%$. That of heavy goods vehicles, which had slowed since 2018 under the effect of the economic slowdown, is also down, but by only $5.9 \%$, supported by the transport of basic necessities.

(1) Including vehicles registered abroad.

Source: MTE/SDES/CCTN

Road traffic is estimated by cross-checking information from vehicle counts on the various road networks (national, departmental, local and urban) with the average annual kilometres travelled by vehicles in the fleet and fuel consumption data. It incorporates that of vehicles registered abroad.

In 2020 and 2021, the traffic balance was partially "rebased". It is now mainly based on the new SDES road vehicle directory (RSVERO), which combines information from registration certificates and technical inspections. Thus, the long series since 1990 on the average annual fleet and the average annual route have been reconstituted. Based on this new source of information, the fleet of vehicles registered in France has been reassessed and amounts to 43.7 million vehicles in 2020.

The decline in diesel motorisation, without taking into account non-rechargeable hybrids, will continue in 2020. For light vehicles, its share in the fleet will drop to $63 \%$ and its share in traffic to $73 \%$. Within the passenger car fleet, alternative engines (electric, plug-in hybrid) represent $0.8 \%$ of the fleet and $0.8 \%$ of traffic.

Since 2017, the decline in the average unit consumption of cars has slowed down. The continuous improvement in technical performance is more difficult to offset the impact of the revival of petrol in registrations and the appeal of SUVs. In 2020, the average unit consumption of cars decreased by $1.1 \%$ for petrol cars and by $0.3 \%$ for diesel cars. It was not affected by the structure of mileage between daily trips and those linked to weekends and holidays, which remained stable.

At the end of 2020, more than $60 \%$ of the passenger car fleet met the Crit'Air 1 or 2 sticker. For heavy goods vehicles, the percentage of the fleet complying with EURO V or EURO VI standards now exceeds $65 \%$. Their virtuous presence in traffic is all the more important as they drive more than older vehicles.

## -17\% Decrease in circulation in 2020

## ROAD TRAFFIC AND CO2 EMISSIONS

Between 1990 and 2019, the total circulation of French and foreign vehicles on French territory had increased by $45 \%$; their associated $\mathrm{CO}_{2}$ emissions, net of renewable energies, only increased by $8 \%$. In 2020, with the fall in traffic (-17\%), these emissions are down 9\% compared to 2019.

Over the long term, various factors are behind the improvement in energy efficiency. Thus, at the level of passenger cars registered in France and in circulation, their average unit consumption since 1990 has fallen by $26 \%$. This downward trend was favoured by the dieselisation of the vehicle fleet, the efforts of manufacturers and drivers and the impact of the bonus/malus system introduced in 2008. The trend was temporarily interrupted in 2017, due to the increase, since 2013, in the share of petrol vehicles which consume more ( 7.1 I per 100 km for petrol, against 6 I for diesel). In 2018, the consumption of passenger cars fell mainly thanks to the efficiency
gains of gasoline, which were greater than for diesel. But in 2019, the decline was again interrupted with the continuous increase in the share of petrol cars in the fleet (+2 points) and their average annual mileage (+3\%).

In 2020, the share of petrol cars continues to increase (+1 point); however, travel restrictions have had a greater impact on private cars whose average annual mileage is less than $10,000 \mathrm{~km}(-17 \%)$, a level not seen since 1990.

Regarding energy efficiency in the transport of goods, it continues to improve. According to the latest figures, the quantity of $\mathrm{CO}_{2}$ emitted by an industrial vehicle, when moving one tonne of goods over one kilometre on French territory, fell by $23 \%$ between 1990 and 2019. This progress is mainly explained by the improvement of vehicle performance (better engine efficiency, increase in the size of vehicles
allowing massification), optimisation of logistics (increase in the filling rate, reduction in empty returns) and the dissemination of good practices in matters of eco-driving. However, in 2020, due to the drop in the flow of goods, these were less well optimised and the drop in fuel consumption was less marked than that of the tonnes transported.

TRAFFIC IN FRANCE AND CORRESPONDING $\mathrm{CO}_{2}$ EMISSIONS NET
AVERAGE CONSUMPTION OF A PASSENGER CAR ON THE ROAD (1)

(1) Unit consumption includes the overconsumption effects associated with biofuels. Source: Road traffic report (MTE/SDES)

(2) Energy efficiency relates to the change in the amount of $\mathrm{CO}_{2}$ emitted in order to transport one tonne of goods (or a passenger) one kilometre by heavy truck (or passenger car) driving on French roads. The reduction of $\mathrm{CO}_{2}$ emissions due to the use of biofuels is taken into account.
Sources: MTE/SDES, CCFA calculations

The circulation of private cars results from two components: the car fleet and their average annual mileage. Over a long period, the growth rate of the fleet has slowed considerably, after the phase of access to motorisation. The development of multi-motorisation, then the significant increases in fuel prices, are the main factors linked to the drop in average annual mileage. Since 2012, there has been an increase in the growth rate of the base of $0.8 \%$ on average. The average annual mileage, meanwhile, is down, $-3 \%$ between 2019 and 2012, in a context of a slowdown in the cycle.

In 2020, new estimates from the Interprofessional Center for Atmospheric Pollution Studies (CITEPA) for road transport show net $\mathrm{CO}_{2}$ emissions from renewable energies of 104 million tonnes compared to 123 in 2019. After the ceiling observed at the start of the 2000s, around 135 million tonnes, a sharp decline was recorded from 2004 to 2009, linked, among other things, to the effects of the economic crisis. Since then, $\mathrm{CO}_{2}$ emissions have stabilised at around 125 million tonnes, thanks to improved energy efficiency. In 2020, following travel restrictions and the development of
teleworking, total road traffic fell by 17\%, leading to a drop in $\mathrm{CO}_{2}$ emissions (-15\%).

In 2020, the net $\mathrm{CO}_{2}$ emissions of renewable energies from road transport were distributed, according to the CITEPA Secten 2021 report, at 55\% for cars, 20\% for light commercial vehicles and $24 \%$ for heavy goods vehicles, buses and cars.

## NEW USES OF THE AUTOMOBILE

The evolution of technology, economic constraints and awareness of environmental issues have encouraged, in several sectors, the development of new consumption and lifestyle trends, which favour use to the detriment of the ownership of goods.

In transport, this trend has materialised through the development of new uses of the automobile, promoting sharing and pooling and based on the use of information and communication technologies. These are in particular carpooling, car-sharing and rental between private individuals.

The shared car makes it possible to reduce the costs of using and maintaining vehicles and to increase, in peri-urban and rural areas, the supply of transport, at a lower cost for the community. In dense areas, it is also a complement to public transport (loads to be transported, staggered timetables) which improves the occupancy rate of
vehicles, with positive effects on the environment and energy consumption.

Among the developments, there is also a strong growth in transport cars with driver (VTC) and the development of new services around mobility (traveller information, route calculations, ticketing, parking assistance).

Automotive groups have adapted their offers to these new needs and are positioning themselves as real mobility operators, by creating new entities dedicated to these activities (Mobilize, Free2Move) and by offering a whole range of new services in France and abroad: short rentals, car-sharing for companies or individuals, "free-floating", but also rental services with driver (taxis, VTC) and MAAS (Mobility As A Service) platforms that combine multimodal information and ticketing tools. They have also invested in companies linked to mobility

CARPOOLING PRACTICE SURVEY OVER LAST 12 MONTHS

$\square 2012 \square 2014 \square 2019 \square 2020$
Source: PARCAUTO TNS Sofres survey handled by CCFA and IFSTTAR

## CARPOOLING

Carpooling is defined in the energy transition law for green growth as "the joint use of a land motor vehicle by a driver and one or more passengers, carried out free of charge, except for the sharing of costs, in in the context of a trip that the driver makes on his own account. Their linking, for this purpose, can be carried out against payment" (Art. L. 3132-1). The mobility orientation law (LOM) promulgated at the end of 2019 reinforced support for carpooling by encouraging the creation of lanes reserved for carpoolers, by authorising communities to pay an allowance to drivers or passengers and by creating the sustainable mobility package. This system allows a public or private employer to set up financial assistance for home-work travel for its employees made with modes other than public transport, and in particular with shared modes such as carpooling.

In practice, the diffusion and development of carpooling are still difficult to measure. According to the various surveys, the regular practice of carpooling affects between 5 and 10\% of the population in France. In 2020, the practice of carpooling is down due to the pandemic and has been done more with those around you. According to the Kantar TNS Parc Auto survey,
10.3\% of respondents made a carpooling trip compared to $13.7 \%$ in 2019. In 2020, 3.6\% of respondents used carpooling for their home-to-work trips (compared to 4.7\% in 2019), $6 \%$ for journeys over 100 km (compared to $8.5 \%$ in 2019) and $4.8 \%$ for journeys under 100 km (compared to $6.1 \%$ in 2019). Carpooling was done with friends and family at 94\% for home-to-work journeys and $81 \%$ for short journeys, compared to $91 \%$ and $74 \%$ respectively the previous year. The latest study carried out by ADEME shows that carpooling is gradually becoming a transport solution in its own, with the average age of the carpooler increasing ( 33 years) and a practice that is no longer exclusively that of young urbanites, but which also affects rural communities and older people. The motivation is essentially economic for $69 \%$ of carpoolers.

Occasional carpooling, generally carried out over long distances, is the most structured. Connecting platforms secure the transaction between drivers and passengers. The share of long journeys organised with a connection structure increased from $25 \%$ in 2012 to $63 \%$ in 2019 but fell in 2020 with the health crisis (57.5\%). The average distances travelled are approximately 239 km per trip and there are 3.5 people per vehicle on average (BlaBlaCar, Zéro Empty Seats, 2019).
and connected services: acquisition of TravelCar for PSA, investments in various start-ups (Karhoo, iCabbi, Glide) for Renault.

## 10\% <br> Of respondents carpooled in 2020 [KANTAR TNS survey]

Source: 6t/ADEME
Home-to-work journeys and short journeys take place more with friends or colleagues, but these segments tend to develop in the offer of market players and the State has set itself the objective of tripling by 2024 the number of daily trips made by carpooling.

As part of the inter-company travel plan (PDIE) of Guyancourt Technocentre, Renault offers its employees the use of Klaxit to carpool. 86\% of registrants found carpoolers on their route and at their times. In addition, Mobilize Invest supports ECOV, which works with local authorities to build spontaneous and dynamic carpooling lines that are reliable and accessible to everyone in suburban and rural areas. For its part, Free2Move has launched Mobility Card, a universal payment card for employees to simplify the implementation of the mobility package for companies.

## NEW USES OF THE AUTOMOBILE

- THE REASONS FOR JOINING A CAR-SHARING SERVICE

Source: National Survey on car-sharing,6t/ADEME, 2019

## CAR-SHARING

The car-sharing activity is defined in the Grenelle II law (article 54) as the pooling of a vehicle or a fleet of motorised land transport vehicles, for the benefit of users who are subscribers or authorised by the body or person managing the vehicles. Each subscriber or authorised user can access a driverless vehicle for the route of their choice and for a limited period. A distinction is made between P2P carsharing (rental between individuals) and B2B commercial carsharing (for employees of a company) or B2C (for individuals).

In commercial car-sharing, the service is said to be "looped" when the customer picks up the vehicle at a station and returns to drop it off at the same station. Conversely, in the "direct track" service, the customer can drop off their vehicle at a station other than the departure station or anywhere within a given perimeter. In the latter case, we then speak of "free-floating". These different systems correspond to very different durations of use and needs.

The latest ADEME survey carried out in 2019 reminds us that the loop offer is more extensive and older than that of direct trace. Nevertheless, the free-floating offer has been developing since 2016. It also shows that B2C car-sharing users are older (47 years old on average), more educated ( $73 \%$
hold a bac +3 or higher) and financially better off than the average population of the large cities in which they reside.

The mobility orientation law, passed at the end of 2019, aims to facilitate the granting by the mobility organising authorities (AOM) of parking spaces reserved for car-sharing vehicles. These reserved parking spaces will be accompanied by a "carsharing label" granted to vehicles that meet the conditions defined by the AOM (type of vehicles authorised, minimum number of rentals per month, etc.). In addition, as with carpooling, the costs incurred in carsharing can now be covered by the sustainable mobility package.

## THE B2C AND B2B OFFER OF FRENCH CAR MANUFACTURERS:

The Renault group offers nearly 10,000 electric vehicles for car-sharing in most European capitals. With the Zity brand (joint-venture with the Ferrovial group), it operates a free-floating car-sharing service with 725 ZOE in Madrid since 2017 and 500 ZOE in Paris since May 2020. With Totem Mobi, it offers Twizy in car-sharing in Marseille and Montpellier. Elsewhere in Europe, it is joining forces with other players to equip car-sharing fleets with
electric vehicles (Fetch Car-Sharing in Amsterdam, Aimo in Stockholm, Green Mobility in Copenhagen). In addition, Renault also offers solutions for its business customers via Glide.io (formerly Renault RCI ), in order to optimise the utilisation rate of their fleet. Finally, the group has forged partnerships with commercial brands in order to offer the service to their customers.

The Free2Move brand created by PSA and its application of the same name, offer self-service car-sharing services in Paris, Madrid, Lisbon, Washington DC and soon Portland and Denver. More than 500 vehicles are offered in each city. In Paris and the nearby suburbs, the application makes it possible, for example, to locate 600 electric vehicles thanks to a fleet made up of Citroën C-Zéro and Peugeot lon and supplemented in the spring of 2020 by Citroën's latest innovation: the 100\% electric Ami. Free2Move also offers services for companies with a connected fleet management system (Connect Fleet), a car-sharing service (Fleet Sharing) and an advisory service on the electrocompatibility (E-mobility Advisor) of fleets.

# NEW USES OF THE AUTOMOBILE 

SHARE OF TAXIS AND CHAUFFEUR-DRIVEN VEHICLES IN THE OFFER OF PUBLIC TRANSPORT FOR PRIVATE INDIVIDUALS (T3P)

END 2016

END 2017

END 2018

TAXIS
CHAUFFEUR-DRIVEN VEHICLES
Source: National Observatory of Special Public Transport of People, CGDD, January 2020

## CHAUFFEUR-DRIVEN TRANSPORT VEHICLES (VOITURES DE TRANSPORT AVEC CHAUFFEUR - (VTC)

The VTC activity belongs to the public transport for private individuals (T3P), defined by the transport code, which also includes taxis and motorised vehicles with two or three wheels, commonly called motorbike taxis.

Since their arrival in France in the early 2010s, VTC services have contributed to expanding the mobility offer by offering a passenger transport service with prior order. However, their rapid development raised many questions about their legality and the competition they could offer to taxis, leading the public authorities to review the regulations in force.

Originally, the status of VTC is inherited from the status of "big discount car" and the profession of "Grand Remisier", drivers of luxury passenger cars. In 2009, this regime was transformed by the Novelli law, which deregulated the activity and created the status of passenger vehicle with driver. The Thévenoud (2014) and Grandguillaume (2018) laws have made it possible to set new regulations applicable to VTCs, now called "chauffeur-driven transport vehicles", and to specify the contours of the profession.

Thus today the activity of VTC is subject to specific installation and operating conditions which distinguish it from the activity of taxis.

- The vehicle used must meet certain "top-of-the-range" requirements. It must have between four and nine seats (including the driver), be in circulation for less than six years (excluding collector's vehicles) and fulfil certain technical characteristics (size, power).
- The driver must obtain a VTC professional card and register in the national register of VTC operators.
- The reservation of the vehicle by the customer is mandatory. The vehicle can therefore neither park nor drive on public roads in search of customers. Electronic marauding is prohibited and remains reserved for taxis.
- The price of the race is totally free, unlike taxi
fares, which are regulated and set by decree.
The National Observatory for Public-Private Transport, created in 2017 and responsible for establishing an inventory of the sector, has drawn up an initial assessment of the activity. It indicates that the number of VTCs registered in the register amounted to 15,000 in 2016 ( $22 \%$ of the public transport for private individuals offer) and jumped to 43,000 in 2018 for 59,000 taxis ( $42 \%$ of the public transport for private individuals offer). This increase is the consequence of the entry into force of the Grandguillaume law on December 31, 2017 (and extended by 3 months), obliging drivers to register in the register to continue their activity. The observatory also indicates that the VTC offer is the highest in Île-de-France, which includes $80 \%$ of the national offer, against a third of the taxi offer.

In August 2017, the Renault group acquired Marcel, a VTC operator in Île-de-France, which it operated for three years by offering the first range of $100 \%$ electric VTCs. On the Stellantis side, the Free2Move application allows more than 21,000 destinations in 150 countries to find the best VTC offer available.

## RENTAL BETWEEN PRIVATE INDIVIDUALS

More recently, car sharing outside the private sphere has also developed and peer-to-peer car rental services have appeared. Rental is done through specialised websites, connecting people who do not know each other. It allows individuals to share their vehicle for a fee and thus make the ownership and maintenance of their vehicle profitable when it is stationary.

A survey conducted by the CNPA indicates that this activity represented $6 \%$ of total short-term rentals (expressed in number of days) in 2016, compared to $3 \%$ the previous year, and that $5 \%$ of license holders have already used it. Users are young ( $44 \%$ are under 35 ), less often in working life than customers of traditional agencies (70\%, compared to $83 \%$ ), and less well-off: $47 \%$ belong to higher socio-professional categories, i.e. 10 points less than those who use traditional rental.

According to the KANTAR TNS PARC AUTO survey, while rental activity is down in 2020 in a context of low mobility ( $5 \%$ of the sample having used it, compared to $8 \%$ in 2019), rentals between individuals have however, increased with 12\% of households among those having resorted to renting, against $7 \%$ the previous year. However, nine out of ten people still say they are very reluctant to provide or rent a car via a peer-topeer rental platform.

## THE CONNECTED AND AUTONOMOUS VEHICLE

The connected vehicle is based on communication and information sharing between vehicles (VTV) or between vehicles and the road or communication infrastructure (VTX), thanks to wireless connectivity systems. Various services are offered to users: entertainment (via Bluetooth or 4G), geolocation data (GNSS systems), real-time traffic information, calculation of energy consumption. In addition, the development of advanced electronic assistance and driving assistance systems (ADAS) integrated into vehicles make it possible to perceive the immediate environment of vehicles through sensors and make driving easier (parking assistance) and safer (intelligent speed adaptation, warning systems in case of loss of attention). In addition, certain safety devices will be made mandatory by European regulations. The progressive development of connectivity and automation technologies should eventually allow the deployment of highly automated vehicles.

From a technical and technological point of view, the "autonomous vehicle" is defined by the SAE (Society of Automotive Engineers) nomenclature, which characterises automation systems by distinguishing between driver assistance systems (levels 1 and 2 available today) and automation systems allowing the driver to delegate the driving task to the system (levels 3 to 5 which are not yet on the market except for a few hundred level 3 vehicles authorised in Japan since 2021).

The UNECE regulation on automated lane-keeping systems (known as "ALKS") adopted on June 24, 2020, is the first technical regulation on level 3 automation. It establishes the strict technical and safety requirements for the "ALKS" function, which is a low-speed driving delegation system that can be activated by the driver only on eligible separate carriageway lanes and in traffic jams. It keeps the vehicle in its lane at a maximum speed of $60 \mathrm{~km} / \mathrm{h}$, by lateral and longitudinal control for a long period and without driver intervention. The entry into force of this regulation in January 2021 is an important step towards the introduction of autonomous vehicles.

The connected and autonomous vehicle will make it possible to develop new uses linked to driving and road safety (warning systems, information feedback), geared towards the vehicle itself (maintenance and repair services), relating to the road infrastructure (traffic management or the infrastructure itself) or to the driver (insurance services or infotainment services). A clear distinction can be made between the use of data to serve objectives of general interest (smooth traffic, improve road safety and the environmental footprint, manage infrastructures) and their use for the development of commercial services. New transport services could also be developed thanks to vehicle automation: automatic valet parking,
flow management in logistics centers or areas, urban shuttles. In the long-distance road transport of goods, "platooning" experiments consist of driving trucks in a convoy without a driver, behind a vehicle at the head of the platoon.

In the coming years, manufacturers plan to deploy several level 3 use cases: autonomous driving in traffic jams (traffic jam Chauffeur), on the highway (Highway Chauffeur) and automated parking. The deployment of transport of several people by robot-taxi (without driver) on well-defined routes is already being tested (ENA Project).

## 110000 <br> Mobilised for the SAM project

The energy transition for green growth law of August 17, 2015 legally qualifies "autonomous vehicles" as vehicles with partial or total delegation of driving, whether passenger cars, goods or passenger transport vehicles.

The driver does not have to monitor the system
constantly.
Non-driving activities
are allowed on a limited
basis.

Automation levels were defined by SAE J3016.

THE CONNECTED AND AUTONOMOUS VEHICLE

According to the terms of the Vienna Convention of November 8, 1968, only driver-controlled vehicles are authorised to use roads and the driver must be able to "neutralise or deactivate" said vehicle, worded in the Convention as follows:

- Every moving vehicle must have a driver (§ 8.1); every driver shall at all times be able to control his vehicle (§ 8.5); a driver of a vehicle shall at all times minimise any activity other than driving (§ 8.6);
- Every driver of a vehicle shall in all circumstances have his vehicle under control (§ 13.1).

Government support for the development of autonomous and connected vehicles The French Government has embarked on an ambitious process for the development of automated vehicles with the objective of French leadership based on three principles: safety, progressiveness and acceptability. The national strategy for the development of autonomous vehicles launched in May 2018 aims to allow the circulation of automated vehicles on public roads by the end of 2022.

The mobility orientation law (LOM law) published in December 2019 has made it possible to adopt various structuring provisions for the development of automated mobility. In particular, it provided for the issuance of an order on criminal liability in the event of the circulation of an autonomous vehicle and its conditions of use. This was published in April 2021 and clarified in a decree of June 29, 2021. Thus, the criminal liability of the driver of a vehicle using an automated driving system will not be incurred during an offense, if during this incident the system exercises dynamic control of the vehicle. The ordinance also sets out the respective responsibilities of the driver and the manufacturer or designer of these systems and the obligations to inform drivers. By September 2022, it will allow the deployment of transport systems up to the highest levels of automation, on predefined routes or areas, on which their safety has been demonstrated.

The Future Investment Program (PIA) set up by the State to finance innovative investments has made it possible, within the framework of PIA3,

- EXAMPLES OF ONBOARD INTELLIGENCE SYSTEMS FOR AUTOMATED DRIVING

to launch two national experimental programs (SAM and ENA) and PIA4, launched on January 8,2021 , will reserve 12.5 billion euros to finance investments in emerging and priority sectors, including sustainable mobility. The "digitalisation and decarbonisation of mobility" strategy notably plans to support automated road transport solutions for passengers or goods.

Connected and autonomous vehicle experiments and tests

## The general framework

In France, the regulatory framework for experiments was established by the ordinance of August 3, 2016, which requires prior authorisation from the Minister responsible for transport, the circulation, on an experimental basis, of vehicles with partial or total delegation of driving on a lane open to public traffic. This framework was supplemented by the law of May 22, 2019, known as the Pact, which authorises experiments with
vehicles with the highest levels of automation with an adapted liability regime, and by the Mobility Orientation Law project aimed at the framework circulation of autonomous vehicles. In 2021, the framework has evolved to open experiments to driverless vehicles on board, delivery vehicles and vehicles in convoy. Since the end of 2014, more than 140 authorisations for experiments have been issued. As of October 20, 2021, 22 experiments are taking place across the country and 12 experimentation requests are being examined.

## THE CONNECTED AND AUTONOMOUS VEHICLE

## The France Autonomous Vehicles program

 As part of the France Autonomous Vehicles experimentation program which accompanies the national strategy, a call for projects for the experimentation of the autonomous road vehicle (EVRA), was launched in June 2019 for experiments covering the main use cases of mobility of people and urban delivery. In April 2019, the Government presented the two projects selected (SAM and ENA) to carry out 16 experiments with autonomous vehicles in real conditions and throughout the territory (rural and urban areas).The SAM (Safety and Acceptability of Driving and Autonomous Mobility) project, coordinated by the PFA, brings together players from the various sectors concerned by autonomous mobility: manufacturers, transport operators, local authorities, infrastructure managers, research laboratories with a shared vision of the issues and results for the production of shared knowledge. 15 teritories are partners, bringing together 21 routes or experimental areas.

The ENA project (Autonomous Shuttle Experiments) piloted by Gustave Eiffel University and launched in 2019, is experimenting with an automated shuttle service in addition to existing urban transport, and a service in sparsely populated rural areas.

## SCOOP / C-ROADS / InterCor projects

Co-funded by the European Commission, the SCOOP project, launched in 2014, aims to pilot the deployment of cooperative intelligent transport systems, i.e. systems based on the exchange of information between connected vehicles and between the vehicle and the road. The vehicles are equipped with sensors which detect events (slippery road, impact, sudden braking, etc.) and on-board units which transmit the information to the vehicles upstream $(\mathrm{V} 2 \mathrm{~V})$ as well as to the manager (V2I) via units in roadside. The manager can also transmit information (construction sites, etc.) to the units on board the vehicles (I2V). The project brings together many public and private partners around the ministry in charge of transport, which coordinates it: local authorities, road managers, car manufacturers PSA and Renault, universities and research centers as well as foreign partners (Spain, Portugal, Austria). Between 2016 and 2018, SCOOP deployed 3,000 vehicles on 2,000 km of roads spread over five sites: Île-de-France, A4, Isère, Bordeaux ring road and Brittany. The objectives were to improve road safety and operating personnel, more efficient traffic management, reduction of emissions and optimisation of infrastructure management costs. At the end of 2019, the results of the project were presented and show that user acceptability still needs to be improved, in particular on the security dimension and informational consistency.

Following the SCOOP project, other projects such as C-Roads or InterCor were launched in order to extend the SCOOP services to other regions on a French and European scale. Thus in 2020 in Europe, 6,000 km are covered by ITS G and $10,000 \mathrm{~km}$ by cellular. On January 5, 2021, the COOPITS application was deployed in the Bordeaux conurbation. It allows the road user to receive information directly from the road manager and promotes eco-driving while respecting the user's privacy.

## Test centers for autonomous and connected vehicles

Funded thanks to the PIA and the lle-de-France Region, a test center for autonomous and connected cars, TEQMO was inaugurated in June 2019 by UTAC in Montlhéry. Composed of 12 km of test tracks associated with modern laboratories, it is aimed at all players involved in driving and connectivity technologies (manufacturers, equipment manufacturers, software suppliers, telecom operators). UTAC and TEQMO thus become a major tool for the development of autonomous and connected vehicles, by creating a French solution in the face of international competitors. In addition, Transpolis, with which Renault Trucks is associated, is a city-laboratory dedicated to innovation and safety. Transpolis now has two test centers in Ain, covering an area of 130 hectares.

THE EXTENDED VEHICLE (EXVE) AND ITS STANDARDISED INTERFACES

Source: ACEA

Use of 5G network technology for autonomous vehicles
Many projects have been launched on several sites in France to carry out use case tests for automated vehicles with 5 G technology. The fifth generation of mobile networks (5G) should allow the improvement of existing services and the development of new services with better speed and greater capacity. For example, the "5G OpenRoad" project, which brings together private and public partners, provides for open road trials to test use cases for autonomous vehicles and provide services on board connected vehicles.
At European level, many projects have also been launched: 5GMED: 21 European players brought together to test and deploy 5 G on road and rail between France and Spain.

## The question of access to vehicle data

The increased use of automated vehicles will develop the data produced for various uses with a significant impact on the development of mobility services. The rules concerning the management of data linked to the automated vehicle, which can exchange information
with its environment, constitute a major subject for the respect of the privacy of individuals. As such, the European regulation on the protection of personal data (GDPR), which came into force in May 2018, makes it possible to strengthen the protection of users' personal data. The mobility orientation law also established rules for making certain data available to public authorities or infrastructure managers.

Many projects (MOSAR, 3SA, SVR, EVA, CTI, etc.) have been launched over the past five years in order to meet cybersecurity challenges with security at the vehicle level but also at the infrastructure and centralised control level according to different scenarios.

In addition, European regulation on cybersecurity and cooperative intelligent transport systems are also significant contributions. This system is supplemented by "flexible" rules of law with the CNIL's compliance pack on connected vehicles in the process of evolution and technical standardisation (ISO).

The "Extended Vehicle" (ExVe) is a concept that car manufacturers, along with major equipment manufacturers and independent distributors, have
wanted to standardise at international level (ISO) since 2014. This concept reflects the concern to take into consideration the extension of the field of action of the vehicle, now very connected (mobility services, diagnosis maintenance repair, entertainment...), with the impacts that such an extension supposes in terms of integrity and security of the system.

The extended vehicle standards set up a system allowing a consistent, accountable and interoperable management of vehicle data:

- Consistent, because they establish a common standard that all companies must respect and because they avoid a multiplication of heterogeneous technical access systems, which would lead to a multiplication of risks in terms of the safety of goods and people.
- Responsible, because they limit the compromise of the vehicle's services (steering, braking, etc.) in all life situations encountered, regardless of the external solicitations, including those for malicious purposes (cyber security issue).
- Interoperable, because the establishment of a standard applied and carried at the international level allows cross-border data management systems to be compatible with each other.

Connected technologies and autonomous driving are preparing new mobility scenarios and the establishment of an expanded economic and legal system in which car manufacturers have a decisive place (see Deloitte/ Fréget report of January 2020). The development of artificial intelligence has a key place in contributing to innovation and the digital and ecological transformation of the automotive sector.

## PASSENGER TRANSPORT PRICE INDEKES

In 2020, the price index for personal vehicles (purchases and use) fell by 2.1\% (compared to $+1.1 \%$ in 2019), in line with the sharp drop in fuel prices ( $-11 \%$ ) which is impacting the "use expenses" item ( $-3.2 \%$ ), while the prices of "vehicle purchases" remained stable (+0.4\% after $+0.6 \%$ in 2019).

In road passenger transport, after two years of slowdown, prices rebounded by $3 \%$ in 2020, in particular due to the acceleration in prices in coach transport and despite the drop observed in private passenger transport (taxis, VTC). Thus, in 2020 as in 2019, the two components of road passenger transport are changing in contrasting ways, but cumulatively over the 2 years, prices have increased in the same way by around $4.5 \%$. Finally, in air transport as in rail transport, prices collapsed by $4.4 \%$ and $5.3 \%$ respectively.

Over the last twenty years, the price indexes of the different modes of passenger transport have evolved in very different ways. Since 2000, the real price indexes, i.e. corrected by the general consumer price index, have increased by $22 \%$ in private passenger transport (taxis, VTC) and by $9 \%$ for personal vehicles, but fell by $11 \%$ for other road passenger transport (buses, coaches) and by $4 \%$ in air transport. In rail passenger transport, real prices increased by 19\% between 2000 and 2015, but have been falling for 5 years, with a price collapse in 2020 linked to tariff adjustments after confinement.

# FREICHT TRANSPORT PRICE INDEXES 

In 2020, freight transport prices are increasing in maritime, rail and air transport, but on reduced volumes due to the health crisis. In road transport, prices fell by $0.9 \%$. The decline was more marked in short-distance road transport (-2.3\%) than in intercity $(-0.6 \%)$, while international prices increased by $0.8 \%$. Finally, in the river sector, prices fell by $0.6 \%$ in 2020.

Since 2006, the road freight transport price index has risen steadily: $+16 \%$ in total, i.e. an average of $+1.1 \%$ per year. The price index for international road transport rose more than that for local or interurban road transport. Over the same period, the price indexes for river transport and air transport experienced more erratic trends; phases of increases between 2006 and 2013 and a downward trend since, with the exception of air freight which rebounded in 2020. This surge in prices is explained by the strong tensions on freight transport capacities following the
virtual shutdown air traffic. Passenger flight restrictions have limited air cargo carrying capacity due to the "mixed" organisation of aircraft carrying both cargo and passengers.

In rail transport, the price index has only been disseminated since 2014, with a history dating back to the first quarter of 2012. Over the observation period 2012-2020, there is a $3 \%$ drop in prices, mainly due to a decline in national rail prices until $2019(-7 \%)$, while international rail prices increased by $9 \%$. In 2020, prices will rise sharply on national rail, while they will fall internationally. Since the opening to competition in 2006, the new operators have developed and now represent $40 \%$ of the volumes transported, i.e. a level comparable to that of Germany.

(1) 2006-2011: very high volatility of sea freight price indexes.

Source: MTE/SDES

FREIGHT TRANSPORT INDEXES IN FRANCE

FREIGHT TRANSPORT INDEXES IN FRANCE: ROAD

The freight transport price indexes are calculated by the SDES statistical service of the Ministry in charge of Transport. For road, river and rail transport, the indexes are developed using the so-called representative services methodology, defined by the loading and unloading locations, the type of goods and the characteristics of the contract between the shipper and the carrier. Price statements are made quarterly. In road and river transport, only activities carried out on behalf of others by companies domiciled in France, whose main activity is freight, are monitored.

For rail transport, the price index, monitored since the $1^{\text {st }}$ quarter of 2012, is based on 111 representative transport services, entrusted by
a sample of shippers to rail transport operators.
For air freight, the index consists of freight transport services departing from France by air waybill. The service is defined by the place of unloading and by the airline in charge of the shipment. The index is developed using the socalled unit value methodology, which incorporates the fuel and security surcharges paid to the airline providing the transport. This price index is linked to the high volatility of fuel prices.

For maritime transport, the price index is made up of transport services on behalf of third parties carried out by companies registered in France whose activity is maritime freight (bulk and ferry). It
is based on international price indexes, unit prices and tariffs. This price index is very volatile, linked to the evolution of bulk prices.

For road freight, intra-annual variations are less significant than for river or air transport, even if fuel represents on average $20 \%$ of the total costs of road freight transport, as shown by the CNR survey (see page 61).

# THE COST OF HOUSEHOLD CAR MOBILITY 

According to the latest "Family budget" survey of 2017, metropolitan households devote on average $15 \%$ of their budget to cars. This budget varies from $20 \%$ among rural households to only $9 \%$ in the Paris conurbation and represents more than half ( $57 \%$ ) of expenses related to the use of the vehicle (fuel, repairs, maintenance, tolls, insurance). These user expenditures amount to $8 \%$ of the total budget but reach $11 \%$ among rural households and $9 \%$ on average among households belonging to the first 3 income quintiles (against $7.4 \%$ for the $5^{\text {th }}$ quintile). The item that weighs the heaviest within this set is the fuel item, which represents $4 \%$ of the total and reaches $6 \%$ in rural areas, compared to only $2 \%$ in the Paris
agglomeration. The least well-off households (Q1Q3) also devote a larger share of their budget to this item (4.3\%) than the richest households who belong to the 5th quintile (3.3\%). Finally, the breakdown by socio-professional category also shows significant contrasts in terms of automobile expenditure. The category of executives and employees, who frequently hold jobs in the tertiary sector in urban areas, devote a lower share of their budget to cars (respectively $13 \%$ and $15 \%$ ). Conversely, the category of farmers, workers and tradesmen, less present in urban areas and more forced to use their vehicle to work, devote $18 \%$ of their budget to cars.

- AUTOMOTIVE BUDGET IN 2017

# -SHARE OF FUEL IN HOUSEHOLD CONSUMPTION IN 2017 

BY RESIDENCE AREA

BY INCOME QUINTILES

The "Family budget" survey conducted on average every five years by INSEE provides an estimate of the average consumption of the various goods and services and makes it possible to compare the consumption structures of the various categories of households according to the different characteristics of these last: socio-professional category, age, income, category of municipality of residence, etc.

Concerning automotive items, there are two important differences compared to the national accounts (page 61). In the treatment of transport insurance expenses, their entirety is considered in the surveys, whereas only the service (expenses less reimbursements) is counted at the macroeconomic level.

Regarding second-hand vehicle expenditure, all of it is counted in the surveys, whereas at the macroeconomic level, it mainly corresponds to the margins of professionals involved in a transaction and does not take into account exchanges between individuals.

The budget survey used in this edition is limited to metropolitan France. The breakdown of the various automotive items is expressed as a percentage of total consumption excluding taxes, duties, loan repayments and major works. Expenditures are broken down here according to the category of municipality of residence and income quintiles. The $5^{\text {th }}$ quintile, for example, here corresponds to the $20 \%$ of households with the highest incomes.

In 2017, the automobile budget of metropolitan households represented $15 \%$ of their total consumption. The acquisition item accounts for less than half of the total (43\%) ranging from 5\% of the budget for the $60 \%$ of households with the lowest incomes (Q1-Q3) to nearly $8 \%$ for the 5th quintile. Conversely, the "use expenditure" item weighs more for households belonging to the first quintiles (9\%) against 7.4\% for the 5th quintile. This difference is in particular linked to the weight of the fuel item for which the poorest households devote 1 point more to it in their budget than the wealthiest households.

The same phenomenon is observed for transportrelated insurance, which represents $2.6 \%$ of the budget of the most modest. As these two items are the most taxed, it thus appears that households belonging to Q1-Q3 pay for the use of their vehicles, in proportion to their consumption, more taxes than households belonging to the richest quintile.

Breaking down by category of municipality of residence, the fuel item appears to be all the higher as the size of the municipality is small. Thus, households in the Paris conurbation devote nearly $2 \%$ of their consumption to it, compared to more than 6\% for households in rural municipalities, which benefit less from public transport and who travel more frequently and over greater distances.

# COST PRICE OF ROAD FREIGHT TRANSPORT 

The synthetic indexes calculated by the National Road Committee (CNR) in 2020 indicate that the cost price of long-distance and regional road freight transport fell by $3.6 \%$ and $3.2 \%$ respectively. This development is linked to the sharp fall in the price of crude oil and therefore the cost of professional diesel, which weighs between 15 and $20 \%$ of the cost of road freight transport.

On the other hand, the CNR specifies that these synthetic indexes are constructed from sources that cannot measure the effects of a sudden crisis, such as that of covid-19, and that these changes are temporary and could be rectified later. Indeed, the CNR hypothesises that the
companies may have suffered additional costs of different kinds which cannot yet be objectively observed. These additional costs are of four types: additional cost of sanitary measures (purchase of masks and gel), payment of a bonus for drivers in activity during confinement, effect of the drop-in activity on fixed costs, increase in journeys at empty. By taking hypotheses on the intensity of these factors, the CNR estimates that a company suffering from all four factors would then record an inflation in the cost price of its vehicles, excluding diesel, of $+6.8 \%$ in 2020. However, these assessments are not representative statistics. Subsequent surveys will provide a better understanding of the impact of the crisis on the cost

The National Road Committee (CNR) publishes, among other things, two indexes reflecting the evolution of the cost of road freight transport carried out on behalf of third parties and relating to long distance or regional transport.

Long distance corresponds to national or international transport carried out by means of articulated sets up to 44 tonnes, the operating constraints of which make it impossible or uncertain for the driver to return daily to his home.

Regional transport, carried out using carrier vehicles with a total weight of between 3.5 and 19 tonnes, corresponds to transport within a region and neighbouring regions and whose operating conditions allow the driver to return daily to his home.

The cost structure resulting from the CNR's annual survey depends both on the evolution of each of the components, but also on the associated operating conditions (mileage travelled, number of hours worked). Thus, a position may see its weight in the structure vary differently from what the evolution of its unit cost may suggest. Here we are mainly interested in the evolution of the cost structure because it better reflects the reality experienced by carriers.

The CNR now takes into account, in the calculation of its indexes, the CICE since 2013, the year of its entry into force, in order to make them comparable
with the post-2019 period. The CICE is indeed transformed from January 1, 2019, into permanent reduction in employers' social security contributions.

In long-distance road freight transport, the largest item of expenditure is driving personnel, whose share has remained stable since 2013, at around 29\%. The second item of expenditure, the ratio of professional diesel amounted to 27\% of the cost price in 2013 before decreasing by 7 points until 2015, then increasing again to oscillate at approximately $24 \%$ the following three years. In 2020, the share of commercial diesel fell by 3 points to $21.5 \%$ of the total.

The share of equipment owned (road tractor and semi-trailer) has remained stable, at a level slightly above $12 \%$ since 2016, after two years of increase, following the rise in the price of new vehicles, linked to the entry in application of the EURO VI environmental standard on January 1, 2014 (approximately 10\%) and the new mandatory safety equipment. The impact of these increases is diluted in the calculation of the cost of ownership by the gradual renewal of vehicles (approximately $1 / 6$ of the fleet per year) and by the slight drop in price observed on semi-trailers. Furthermore, in 2020, interest rates remain at historically low levels. The emergence of new, more expensive engines will require appropriate financing support, so as not to stray too far from overall market costs.

The maintenance cost index, which includes tyres and vehicle repairs, has remained stable at $8.2 \%$ since 2016 and increased to $8.6 \%$ in 2020. Tyre prices have been on the rise between 2013 and 2015, before approaching their starting level and maintenance on Euro VI standard vehicles, in force for 4 years, seems more expensive than for previous generations (example: exhaust with particle filtering). Finally, the "infrastructure" item increased in 2020 (+0.3 point), to reach $7.4 \%$ of the total cost.

In regional transport, the costs related to driving personnel weigh more than in long-distance transport. They amount to $40.8 \%$ of the total in 2020. The weight of professional diesel comes second in the cost price of regional transport with $22.6 \%$. Ownership of equipment, the third item of expenditure, amounted to $22.6 \%$ of costs in 2020. Lastly, repair maintenance costs stood at 7.7\% of the total in 2020.

## CAR PRICE INDEXES

In 2020, consumer prices slowed for the second consecutive year ( $+0.5 \%$, after $+1.1 \%$ ) with the fall in energy and transport services prices.

Within automobile expenditure, the prices of new automobiles slowed in 2020 to $+0.4 \%$, after $+0.7 \%$ in 2019. On the other hand, the price index for spare parts, accessories and maintenancerepair of vehicles continued to increase in 2020, at $+2.9 \%$, after an increase of $+2.7 \%$ in 2019.

This index groups together various components which evolve in a contrasting manner. The cost of maintenance-repair, which includes the value of the service (cost of labour and supplies), increased further in 2020 to $+3.2 \%$, i.e. an increase of $54 \%$ since 2005 (of which $60 \%$ for labour), while the price index for spare parts and accessories slowed ( $+0.9 \%$ in 2020) and remained stable over the period 2005-2020 (+1\%).

With the collapse in demand for petroleum products linked to the health crisis, the prices of petroleum products fell sharply and led to a drop in the prices of finished products, such as fuels, the prices of which fell by $11.9 \%$ in 2020.

## - YEAR ON YEAR AUTOMOTIVE PRICE CHANGES

|  | Consumer prices | New car prices | Prices of car parts, accessories, repair and maintenance | Of which parts and accessories | Of which repair and maintenance | Fuel prices |

RETAIL PRICE OF DIESEL IN FRANCE AND THAT FOR JANUARY 1999,
INDEXED FOR CONSUMER PRICES

HARMONISED PRICE INDEXES IN THE EURO ZONE
(17 COUNTRIES)

In 2020, the quality of the consumer price index was affected by the health crisis, which led to the suspension of price collection for several months of the year and the unavailability for sale of certain products impacting the structure of consumption.

The new car price index compares the prices of a range of cars of similar technical characteristics, so as not to take into account price increases resulting from improvements in quality or equipment, nor from the evolution of the sales structure. It takes into consideration the rebates offered periodically (excluding gentlemen's agreement), as well as the bonus/penalty system.

In the graph above, the prices of the main automotive-related items are expressed in real terms, i.e. corrected by the general consumer price index.

Over the period 1992-2010, the real price of new cars fell regularly, under the continuous effect of competition and occasional market support measures (bonus/penalty system and scrapping bonus since 2008). Nevertheless, the tightening of the ecological bonus/penalty scales, the implementation of new standards making pollution control systems more expensive and the addition of new elements intended to improve road safety have contributed to the growth in prices since 2011.

For the "parts, accessories, maintenance and repair services" item, the real price index has been growing since 2000, but it is "maintenance and repair services" that are driving the index up due to the rise in labor (labour cost, skills development, shortage of skilled labour). Conversely, the real price of parts and accessories tends to decline over a long period.

In the euro zone (19 countries), Eurostat calculates a price index for the purchase of new and used cars; the data between the different countries is harmonised. Since 1996, the evolution of this index, compared to that of the general price index, shows a phenomenon of strong pressure on prices linked, as in France, to the intensity of competition and the constraint on household purchasing power. In 2020, the general price index gained $38 \%$ compared to 2000, while that of new and used car purchases only increased by $20 \%$.

## hOUSEHOLD CAR CONSUMPTION

In 2020, the health crisis and the measures put in place to deal with it (confinements, curfews, closure of shops) led to a historic drop in household consumption expenditure ( $-7.1 \%$ ) despite the increase in the purchasing power ( $+0.4 \%$ after $+2.6 \%$ in 2019). This is holding up thanks to the resilience of gross disposable income (+1\% in value against $+3.4 \%$ in 2019) and the slowdown in consumer spending prices ( $+0.6 \%$, after $+0.8 \%$ in 2019), due to lower energy prices. This
slight increase in purchasing power, combined with the decline in consumption, led to an exceptional increase in the household savings rate, which rose from $15 \%$ in 2019 to 21.4\% in 2020.

The decline in household consumption is particularly marked in services (transport, leisure, catering and accommodation), as well as for goods in the sectors affected by the restrictive measures (clothing, automotive).

Vehicle purchases, impacted by travel restrictions and the closure of car dealerships, fell by $16 \%$ in value, to 42 billion euros, or $30 \%$ of car spending. Car purchases (new and used), which represent $84 \%$ of the total, fell by
$19 \%$, with a more marked decline for new cars (-20\%) than for used cars (-17\%). Conversely, spending on cycles rose very sharply (+24\%).

Expenditure on maintenance-repairs also fell (-6\%), but to a lesser extent, thanks to the essential nature attributed to these services during the confinement allowing them to open, and due to an aging fleet. They now account for $30 \%$ of total automotive expenditure, compared to $23 \%$ in 2000. Finally, fuel purchases fell by $24 \%$, to 31 billion euros, due to travel restrictions and lower fuel prices.

AUTOMOTIVE BUDGET COEFFICIENTS FROM 2000 TO 2020

- FUEL, LUBRICANTS $\quad=-$ NEW VEHICLES PURCHASE - VEHICLES PURCHASE

According to national accounts data, which are based on different concepts from those used in the Family Budget survey (see page 60), households spent 137 billion euros on their individual transport in 2020, i.e. a decline of $14 \%$ compared to 2019. Public transport services, for their part, fell by more than $50 \%$ to 15 billion euros.

The share of car consumption in national actual consumption, called the «car budget coefficient», thus fell to $8.2 \%$ in 2020 , compared to $9.6 \%$ in 2019. Since the 2009 crisis, this coefficient has generally fluctuated around $9 \%$, while it varied between $9 \%$ and $11 \%$ over the previous period

## (1990-2009).

Prior to 2003, the leading item of automobile expenditure was vehicle purchases, which represented between $3.5 \%$ and $4.5 \%$ of actual household consumption. It now represents around $3 \%$ (2.6\% in 2020 and $2.2 \%$ for cars alone) and comes in second place behind vehicle use expenses (excluding fuel). The downward trend in purchases of new vehicles weighs on this budget coefficient, with purchases of new cars now representing only $60 \%$ of car purchases, against 82\% in 1990.

Within user expenditure, the budget coefficient for "vehicle maintenance - repair", which has been rising since 2014, remains stable in 2020, thanks to the much less steep fall in this expenditure item compared to the other items. The amount of these expenditures amounts to 41 billion euros.

Finally, the weight of the "fuel" item has fluctuated a lot in recent years in line with the evolution of energy prices. In 2020, with the decline in prices and consumption in volume, the associated budget coefficient fell by 0.5 point, from $2.4 \%$ in 2019 to $1.9 \%$. Fuel expenditure thus amounts to 31 billion euros.

AUTOMOBILE FINANCING

In 2020, consumer credit was strongly impacted by the health crisis, despite interest rates still historically low. The cumulative production of new loans fell by $6 \%$ at the end of December, i.e. the largest drop recorded since the 2008 crisis. With now nearly $65 \%$ of new cars financed on credit by households, the decline in registrations has reflected in a sharp drop in the number of new car financing transactions declared by the ASF in 2020: $-25 \%$ for allocated credit and $-18 \%$ for rental formulas.

The share of car loans allocated in the financing of new car purchases by individuals continues to decrease in favour of rental formulas. Leasing has now become the dominant credit financing method ( $72 \%$ in 2020 compared to $14 \%$ in 2010), ahead of assigned car loans ( $27 \%$ in 2020 compared to $49 \%$ in 2010) and personal loans. Within rental, Rental with Option to Purchase (LOA) largely dominates ( $90 \%$ of financing by rental), while Rental Without Option to Purchase (LSOA) remains marginal for households.

For second-hand vehicles purchased by households, cash purchase remains the main method of financing (nearly 60\%). However, the use of conventional credit for the purchase of used cars is on the rise (+28\% between 2013 and 2019), despite the decline observed in 2020 (-12\%). Rental formulas are also being developed for used cars. Since 2016, the number of funding applications has more than tripled according to ASF figures.

Credit financing of business equipment with new vehicles (passenger cars, light commercial vehicles and industrial vehicles) also suffered from the health crisis, but to a lesser extent, with a $10 \%$ drop in the number of financing files in 2020. Unlike households, companies favour LSOA, which represents $64 \%$ of rental formulas and in particular Long-Term Rental (95\% of LSOA formulas). The LOA represents only $35 \%$ of new vehicle financing files.

TOTAL AMOUNTS OVER TWELVE MONTHS OF NEW CONSUMER LOANS TO INDIVIDUALS (EXCEPT OVERDRAFTS)

INTEREST RATES OF NEW CONSUMER LOANS TO INDIVIDUALS (NOT INCLUDING OVERDRAFTS, Credit rate as a \% ANNUAL INTEREST RATE)

CHANGES IN CREDIT FINANCING OF NEW CARS PURCHASED BY INDIVIDUALS

Car buyers, new or used, have recourse to financing if they cannot or do not want to buy cash.

Four funding options are available to them:

- Personal or bank loans granted by a bank or credit institution. The borrower is free to use his credit as he sees fit.
- Affected automobile credit or conventional credit; it is granted by financial companies, subsidiaries of manufacturers and importers, or by financial companies independent of manufacturers, but subsidiaries of financial or banking groups. It is used for a specific purchase.
- Rental with purchase option (LOA) also called leasing, rental with promise of sale or leasing; it is a consumer credit that allows you to have the disposal of a car against the payment of monthly instalments during the lease period, which can be up to eighty-four months, i.e. seven years; the
purchase option can be exercised during the lease or at its end.
- Leasing without purchase option (LSOA) combines financial leasing and long-term leasing. These are operations without the possibility for the tenant to become the owner at the end of the contract.

Results from various sources (professional associations, registration statistics, surveys, etc.) make it possible to estimate the use of credit by households buying a new car.

In 2020, the financing of new or used vehicles was strongly affected by the health crisis and the decline in registrations. However, this has not changed the distribution of private car financing methods by households or businesses. Affected car loans, already in sharp decline for more than 10 years, suffered more from the crisis than rental formulas.

For new cars purchased by households, the number of affected loans fell by $26 \%$, while the contraction in LOA operations was less severe (-12\%). For companies, the decline is respectively $-47 \%$ for assigned credits and $-14 \%$ for LOA. The LSOA, the dominant mode of financing for businesses, held up better with a drop of only $5 \%$.

Motor trade turnover amounted to 87 billion euros in 2020, a decrease of $12.3 \%$ compared to the record level of 2019. However, it remains much higher than during the last crisis in 2013, where it had fallen to 74 billion euros. The sector, considered non-essential, was particularly affected by the closure of factories and concessions during the first confinement.

Vehicle maintenance and repair, which had been growing slightly since 2018 (+3.4\% in 2019, after $+4.8 \%$ in 2018) fell by $5.7 \%$ and fell back to its 2016 level. Although repair services remained open all year, activity was impacted by the drop in road traffic linked to travel restrictions, thus reducing visits to workshops, from 2.7 on average in 2019 to 1 ,6 in 2020 (Kantar TNS Car Park survey).

Turnover in the automotive equipment retail trade fell by $5.8 \%$ in 2020. This decline has been observed since 2017 ( $-11 \%$ since that date), but it was accentuated in 2020 by the reduction in the frequency of accidents

- LIGHT VEHICLE SALES NETWORKS IN FRANCE ON JANUARY 1, 2021

linked to the drop in road traffic.

Finally, the fuel retail trade fell by $25.9 \%$, after an increase of more than $7 \%$ in 2018, and stood at 13 billion euros in 2020. This decline is explained both by a volume effect linked to traffic restrictions, but also by the fall effect in the price of a barrel of Brent.

According to data from INSEE-Esane, the operating margin rate (gross operating surplus / value added at factor cost) of motor vehicle trade rose sharply between 2015 and 2018, from 15 to 22\%. The investment rate (tangible investment / value added excluding tax) rose from $11 \%$ to $21 \%$. In motor vehicle maintenance and repair, these two indicators remained stable at around $19 \%$ and $12 \%$ in 2018.

Since the 1990s, automobile distribution has experienced a continuous movement of concentration, linked to increased geographical coverage and the development of multi-branding. In 2020, the 100
largest automobile distribution groups sold more than 1.1 million new vehicles, or $68 \%$ of volumes, up 10 points compared to 2019. They achieved a turnover of 44,6 billion euros ( $62 \%$ of total automotive trade), down "only" 6\% compared to 2019. These distributors withstood the crisis particularly well thanks to their various activities (maintenance-repair, spare parts) and their presence on the second-hand market. The 10 largest distributors alone account for $21 \%$ of volumes sold (compared to $17 \%$ in 2019) and $23 \%$ of automotive sales, with 9 out of 10 groups now posting sales of more than 1 billion euros, compared to just one. in 2015.

Source: INSEE - Trade Accounts, base 2010 of national accounts: (sd) semi-definitive; (p) provisional

To guarantee a high level of quality in sales and after-sales, the distribution networks of automotive brands are based on the selection of distributors and repairers capable of applying the requirements of the latter and of customer service. The cooperation between the manufacturers, their distributors and their authorised repairers makes it possible to ensure, in addition to maintenance and repair, the warranty service, the safety of users, the preservation of the environment, the availability of spare parts and information on technical developments.

As of January 1, 2021, the primary network made up of the subsidiaries of manufacturers and dealers includes 6,067 points of sale, out of a total of 13,536 points of sale in France.

In terms of car repair, there are also independent networks (in 2017: 14,500 MRA - Automobile Repair Mechanics, 1,270 auto centers and 860 quick repair centers). According to 2016 data, manufacturer networks (authorised dealership repairers and agents) represent $35 \%$ of the repair market share, MRAs, $32 \%$, auto centres, $15 \%$, tyre repairers, $8 \%$ and quick repairers, $6 \%$.

## CIRCULAR ECONOMY

According to ADEME, the circular economy can be defined as an economic system of exchange and production which, at all stages of the life cycle of products (goods and services), aims to increase the efficiency of the use resources and reduce environmental impact.

The circular economy of the automobile concerns the vehicle (passenger cars, vans and now trucks) and its consumables (tyres, oils, batteries, etc.).

An end-of-life vehicle (ELV) is a vehicle that its last holder hands over to a third party for destruction. More than 1.6 million ELVs were taken care of by the approved sector in 2019, compared to 1.1 million in 2017. The bonus systems for conversion or scrapping lead to better care of vehicles by the centers approved treatment.

ADEME measures the rate of reuse and recovery of ELVs. This ratio is the sum of the rate of reuse
and recycling and that of energy recovery. This rate has increased by 13 points since 2010.

-SIMPLIFIED CHART OF PROCESSING OF AN ELV

Source: ADEME

In France, more than 1.6 million end-of-life vehicles were taken care of by the sector in 2019 and treated by around 1,635 approved establishments: ELV centres. Their average age was 19.2 years in 2019. According to ADEME, the average mass of a passenger car is just over one tonne in 2019 ( $1,118 \mathrm{~kg}$ ). It is growing slowly but steadily (it stood at 974 kg in 2010).

The resale of used spare parts contributes to the achievement of recycling rates and contributes to the economic balance of the automotive industry. The second-hand parts market now represents 4 to $5 \%$ of the repair parts market.

The level of collection and processing of ELVs and automotive components is linked to the situation of the market for new vehicles, the economic context, the establishment over the given period of a support system for the withdrawal of old vehicles from the fleet and to technical progress reducing the frequency of replacement of components.

The processing of end-of-life vehicles must comply with performance levels defined by the European directive of September 18, 2000. Since 2015, the objective has been $95 \%$ reuse and recovery, including $85 \%$ recycling and reuse. Some sites already exceed this level.

In 2019, the material breakdown of an ELV shows in particular: 75\% metals (ferrous metals: 70\%, nonferrous metals: $4 \%$ and electrical harnesses: $1 \%$ ), $12 \%$ plastics, $3 \%$ glass and $2 \%$ of textiles. This illustrates the diversity of materials that go into the composition of a vehicle and the complexity for the optimal reprocessing of each of them.

Certain consumable parts (oils, batteries, etc.) of the vehicles are also recycled during the life of the vehicle. In addition, car manufacturers plan to use an increasing share of recycled materials, including certain plastics such as polypropylene.

The maintenance of vehicles in the fleet generates an average of more than 200,000 tonnes of used engine oil each year. The recycling of these oils, which are collected by approved collectors, absolutely requires that they are never mixed with other liquids (water, cooling liquids, solvents, etc.). The oils are then either regenerated when possible ( $75 \%$ of volumes) or recovered for energy.

In 2019, the collection of automotive accumulators (battery intended to power a vehicle starting, lighting or ignition system) decreased by 7.7\% compared to 2018, with 153,570 tonnes collected. The recycling efficiency of lead-acid batteries reached $86 \%$.

The collection of the automotive tyre sector (light vehicles and heavy goods vehicles) amounted to 478,000 tonnes in 2019, an increase of $4.5 \%$ compared to 2018. The collection rate amounted to 93.7 \% (i.e. +1.3 point compared to 2018). The recovery rate for car tyres has now increased to $100 \%$. In 2019, around $46 \%$ of these tyres were intended for energy recovery (substitute fuel in cement plants, for example), $37.4 \%$ for material recovery, half of which for granulation (sports fields, street furniture), $16.1 \%$ to reuse ( $12.3 \%$ for secondhand resale and $3.7 \%$ for retreading) and $0.8 \%$ to public works.

Retreading is the technique of giving a used tyre a new tread. In 2019, the automotive tyre retreading market fell by $2 \%$, including a $4 \%$ decline for light vehicles. These retreads are increasingly facing competition from low-cost new tyres from overseas. For trucks however, nominative retreading (the tyre belongs to you and you have it retreaded) is mainly used and is not taken into account in these figures.

## CIRCULAR ECONOMY

The energy transition law for green growth of August 17, 2015, aims to promote the market for parts from the circular economy (PIEC), by requiring maintenance or repair professionals to inform consumers of the possibility of opting for the use, for certain categories of spare parts, of parts from the circular economy instead of new parts.

The decree of May 30, 2016, specifies that the parts resulting from the circular economy are the components and elements marketed by the approved ELV centres and the components and elements reconditioned by the manufacturer (constructor for example), according to precise specifications, either by the manufacturer or in a controlled workshop, under the name standard exchange (decree of October 4, 1978).

Vehicles are marketed by producers (manufacturers and importers) via a network of distributors. At the end of its life, the vehicle must be returned to an approved ELV centre so that it can be treated according to precise specifications allowing compliance with health and environmental rules. This is responsible for cleaning it up (removal of fluids - fuel oils, brake fluid, air conditioning, etc. -, batteries and securing pyrotechnic devices) and dismantling parts for second-hand resale or recycling, then sends the carcass obtained to one of the

59 approved shredders (2019 data, ADEME). These grind the vehicle to separate the different materials that compose it. The latter, when they are sorted, can be used again to manufacture other products (recycling). If the components are neither reused nor recycled, they can be recovered for energy (heat, cogeneration).

## AUTOMOTIVE INDUSTRY PRODUCTION AND ITS ECONOMIC IIPPACT

The production of the automotive branch amounted to 69 billion euros in 2019, a decrease of $1 \%$ compared to the previous year and an increase of $34 \%$ compared to 2013, the last year of decline in the European market.

In the new 2014 base, where research and development expenses are now accounted for as Gross Fixed Capital Formation (GFCF), total purchases (or intermediate consumption), including from the branch itself, represent more than 4 times its Value Added (VA). In 2019, they fell by $2 \%$ compared to the previous year for an amount of 55 billion euros, but have increased by 42\% since 2013.

Since 2010, VA has fluctuated around $€ 13$ billion, i.e. a level close to that observed in the mid-2000s. It increased by 3\% in 2019.

As a guarantee of future production in a highly capital-intensive industry, the investment rate (GFCF/VA ratio) is generally maintained at a high level in this period when European markets in 2019 are approaching their pre-crisis level. The margin rate (ratio between gross operating surplus and VA) has fluctuated around 43\% since 2015 and reached 44\% in 2019.

- ANALYSIS OF AUTOMOTIVE INDUSTRY PRODUCTION (ASA \% OF TOTAL PURCHASES)

(1) These data are provisional.
(2) Total purchases (intermediate consumption) refers to the value of goods and services transformed or consumed fully during the production process. The distribution of purchases by industry is expressed by volume. Since 2010 the research and development costs are no longer included in intermediate consumption, but in GFCF. It does not include the depreciation of fixed production assets, which is recorded in uses of capital employed.
Source: INSEE - National accounts (base 2014 excl. years before 2010: base 2010)

29\% of total purchases by the automotive branch, which represent more than three quarters of its production, are made by the branch itself, compared to $23 \%$ in 2012, and the remaining $71 \%$ by other branches.

Purchases from "other industries" amount to $36 \%$ of all purchases, of which metallurgy and
the manufacture of metal products remain the leading suppliers ( $16 \%$ of total purchases, down slightly but steadily).

Purchases from machinery and equipment manufacturers (excluding electrical, electronic and IT products) account for $12 \%$ of total automotive industry purchases.

In the 2014 base, where research and development expenditure is accounted for in GFCF, the automotive industry devotes $14 \%$ of its purchases to the tertiary sector, against $13 \%$ in 2010. Part of these purchases is intended in particular for business support activities (whose ratio fluctuates around $7.5 \%$ ).

# OEMS AND INDUSTRIAL SUPPLIERS TO THE AUTOMOTIVE INDUSTRY 

Automotive manufacturing is a structuring industry for its suppliers and for the French economy.

The evolution of automotive construction involves the sector of equipment manufacturers and other suppliers, such as plastics processing, industrial rubber, foundry, industrial metal services, etc.

In the 2018-2022 Automotive Sector Strategic Contract, the number of employees in the entire sector is estimated at 400,000 people and the turnover at 155 billion euros.

According to Eurostat, the automotive industry and the French equipment industry respectively rank second and third in Europe in terms of turnover. The automotive sector has experienced an exceptional period in recent years. According to the study by the Metallurgy Observatory (impacts of changes in automobile construction on employment and skills), the sector lost $30 \%$ of its jobs between 2010 and 2019, affecting subcontractors in contrasting ways. The energy transition will result in major changes to the detriment, for example, of the metallurgy sectors, and to the benefit of the IT and electronics sectors.

## - WORKFORCE OF THE AUTOMOTIVE INDUSTRY BY ACTIVITY

(2) Metal products, rubber products, metallurgy, IT products, mechanical parts, glass products, textiles, etc.

Sources: DGE, 2012 survey of companies in the automotive industry; Insee Esane 2011; DGE calculations

A study by the Direction Générale des Entreprises, published in 2015, estimates that the automotive industrial sector (excluding research and development and other services) employed in 2012, 441,000 «full-time equivalent» employees, including 211,000 in the core and 230,000 in the periphery (see table above). It also estimated the turnover of the entire sector at more than 140 billion euros ( 155 billion in 2018) and its added value at more than 20 billion euros. Moreover, the export rate of the sector is higher than that of the manufacturing industry ( $43 \%$ against $34 \%$ ). Within the automotive sector, this ratio is higher for the core (56\%) than for the periphery (35\%).

According to data from the FIEV (Federation of Equipment Industries for Vehicles), the workforce of equipment manufacturers amounted to 62,053 employees at the end of 2020, a drop of $12 \%$ compared to 2019 (and 27\% compared to 2011), for a turnover of 13 billion euros ( $55 \%$ for export), down $29 \%$ compared to 2019. The equipment manufacturers target two types of market: the original equipment, whose equipment is intended
for assembly lines, and that of aftermarket or spare parts. The share of turnover generated from original equipment in France or for export represents just over $80 \%$ of the total.

The outsourcing process has resulted in even greater recourse to suppliers, whose services represent a high and growing share of the cost price of manufacturing a vehicle (around $85 \%$ according to the FIEV).

In recent years, among other automotive suppliers, nearly one-fifth of plastics and electronic equipment business has been automotive. In addition, 10\% of the domestic mechanical engineering market was intended for the automotive industry. For forging and foundry, this share was around $50 \%$. This ratio was $70 \%$ in the polymers and rubbers sector. In addition, according to the Interim Observatory, the automotive industry (excluding suppliers) represents on average 4.5\% of job volumes (in fulltime equivalent). In 2020, this figure fell to $2.9 \%$.

The French automotive industry still relies on its

French industrial base. It represents significant shares of the activity of technical plastic parts, industrial rubber markets, foundry, industrial metal services, which are composed in particular of the sectors of cutting, stamping, industrial mechanics, bar turning, forging, stamping and coating of metals. To express the total industrial weight of the automotive sector, it is necessary to add to these automotive suppliers what represents, for example, the automotive industry's purchases in France from other sectors such as the steel industry (of which the automotive industry represents 25 $\%$ of tonnage), chemicals (10\% for all transport materials) and energy producers (see page 70).

## EMPLOYMENT

In a broad sense, 2.2 million people had their jobs provided by the car in 2020, i.e. more than $8 \%$ of the employed working population.

Strictly speaking, the automotive industry employed 215,000 people, i.e. around $7 \%$ of salaried employment in the whole of industry (including extractive industries, food industries and industrial companies), which has been falling steadily since years.

After the 2009 crisis, the lack of competitiveness

continued to weigh on automotive industrial activities, including those upstream. However, it eased off with the rise of the market. Regarding use, the businesses are by nature less sensitive to it, through their links with the vehicle fleet, which continues to progress; nevertheless, the number of jobs fell slightly with the crisis, but in recent years a plateau seems to have been reached. These changes already include the first impacts of the ecological and digital transition, which will modify professions and skills (see page 68). In 2020, the health crisis weighed on activity, but its
effects on employment were limited by the support mechanisms put in place by the government in the various automotive-related sectors.

GEOGRAPHIC BREAKDOWN OF AUTOMOTIVE INDUSTRY EMPLOYEES IN 2006 AND 2020

The automotive industry, one of the main contributors to industrial production in France, generated around 430,000 jobs, through its production and its purchases from other branches (source ESANE). It should be recalled that, from now on, the workforce linked to the automotive industry is excluding temporary workers, the latter now being counted in purchases at the service level. The number of temporary workers concerned in full-time job equivalent (FTE) amounted on average to around 21,000 people between 2011 and 2015, which corresponded to years of low production in France. However, this figure can reach 35,000 people when production is at a high level (DARES source). In addition, following the change in nomenclature (see pages 88-89), the workforce of automotive suppliers now includes those from manufacturers of automotive seats and those of electrical equipment for motors and
vehicles, which previously figured in purchases at the level of manufacturing and energy industry.
from public authorities and the support mechanisms have maintained activity and employment.

The use of the automobile concerned 546,000 jobs, which are linked in particular to the sectors of services linked to vehicles (sale, repair, trade in automobile equipment, rental, etc.), fuels and recycling (oils, demolition, etc.). These figures correspond both to employees, but also to individual entrepreneurs (or self-employed).

Finally, road transport (passengers and goods) and their infrastructure employed around 1.2 million people thanks to the maintenance of urban public transport, taxis and VTC, but also essential road transport of goods even in times of health crisis. On the infrastructure side, the good performance of orders

According to ACOSS data, Île-de-France represents $20 \%$ of salaried employees in the automotive industry (manufacturers, equipment manufacturers and bodybuilders) in 2020. The other main regions of the automotive industry are Hauts-de-France (15\%), which passed in front of the Grand Est (14\%), Auvergne-Rhône-Alpes (12\%), passing in front of Bourgogne-Franche-Comté (10\%), followed by Normandy ( $9 \%$ ), Pays de la Loire (7\%). This geographical distribution is reflected in the figures on the employment of equipment manufacturers in France in 2020, published by the FIEV.

(1) On 01/17/2021, the PSA group and the FCA group (which produced 3.4 million vehicles in 2020) merge to create the Stellantis group.
(2) Excluding double production of Opel Movano and Opel Vivaro from 2017.
(3) Cars derivatives have been accounted for in cars.

## DELIVERIES BY FRENCH MANUFACTURERS OUTSIDE FRANCE

The perimeter of the groups is the one of January 1st of the year of the data.
Vehicle deliveries by French manufacturers include mounted vehicles and spare parts collections. From 2005, deliveries from Dacia outside France are included in the scope, then those of Renault Samsung Motors in 2007. In addition, some deliveries are assigned to zones, but not to countries.
The integration of Lada into the Renault Group on January 1, 2017, then from Jinbei and Huasong on January 1, 2018 and finally from Opel PSA Group since August 1, 2017 have a strong impact on delivery figures.
From 2018, the scope of deliveries changes to be closer to sales. In general, the deliveries corresponding to productions for partners are no longer counted In addition, reclassifications of vehicles in the categories "passenger cars" and "commercial vehicles" are made locally.

## PHYSICAL AND FINANCIAL DATA FROM THE AUTOMOTIUE MANUFACTURING INDUSTRY

Physical and financial data derive from annual enterprise surveys (EAE) on the automotive sector. Since 2008, they have been replaced by the ESANE information system, which combines administrative data and surveys.

These statistics are one of the main sources of our understanding of French industry. SESSI, previously the Secretary of State for Industry's statistics department and now attached to INSEE, uses those figures.

The data reflects the activity of companies with French and foreign capital, located in France, and whose main activity can extend outside France.

The lifespan of companies (creation, reorganisation, acquisition, sale) can feature major variations from one year to the next.

The introduction of a new economic nomenclature, taking into account data both from surveys and administrative data (and in particular, crossreferencing both), and new rules governing statistics (ordering parties, etc.) are the reason behind a slight reduction in the scope of the sector between 2007 and 2008.

From 2016, INSEE was basing its work on the notion of 'enterprise' defined by decree 20081354 in application of the 'modernisation of the
economy' law (LME) which is based on the notion of groups of companies (rather than legal units), so as to better take into account the new economic realities that have arisen through globalisation. Data since 2012 (below) come from this new source. Trends between the old and new scopes are minor for the moment.

(1) CCFA estimates based on FIEV, INSEE, OPCO2i / Observatoire de la Métallurgie data.
(2) Until 2007, these are actual employees: average employee numbers, corrected by the balance of employees hired (temporary staff) and quoted as hired staff.

## PHYSICAL AND FINANCIAL DATA FROM THE AUTOMOTIVE EQUIPMENT INDUSTRY

The physical and financial data in the table below are taken from surveys (EAE reports) conducted every year of French companies in the automotive equipment manufacturing industry and from 2008, from the new ESANE information system.

In 2019, ESANE data relating to the 2017 financial year were produced and disseminated for the first time in "companies" (in the economic sense) across the field. An enterprise, in the economic sense, is the smallest combination of legal units which constitutes an organisational unit for the production of goods or services, enjoying a certain autonomy of decision, in particular for the allocation of its current resources (Law of modernisation of the economy LME - of August 4, 2008). This definition is based on the notion of a group of companies (rather than a legal unit), and makes it possible to take better account of new economic realities.

From the 2013 vintage until the 2016 vintage, only the largest groups were thus taken into account (in 2016, around fifty of the largest groups broken down into around one hundred companies). All the other groups (small, medium or large) are taken into account in the company statistics from the 2017 vintage. For each of these groups, we assume that all the legal units in the ESANE field which compose it form one company and one. These changes explain the differences observed compared to the previous edition.

In 1993, the French nomenclature of activity (NAF1), harmonised in the European Union, was introduced. The reclassification of certain companies (metalworking, electrical equipment, car seats) in other nomenclatures leads to a statistical break. Since 2008, this nomenclature has evolved into the NAF2, still harmonised at the European
level: manufacturers of electrical equipment for engines and vehicles, as well as manufacturers of seats for motor vehicles, have been added in particular to automotive equipment suppliers.

Companies listed in the new "automotive equipment manufacturing" sector do not represent, therefore, all suppliers of the automotive industry. Added to these should be manufacturers of glass, tyres, doors and locks and automotive springs..

In addition to these activities, the automotive manufacturing and automotive equipment manufacturing industries purchase a number of intermediate products (metals, rubber, plastics, etc.), services (consulting, research, advertising, etc.) and capital goods.

The CCFA provides statistics and information on the automotive world, available on its website www.ccfa.fr Contact: ecostats@ccfa.fr

[^0]:    "The French Automotive Industry - Analysis and Statistics" can be downloaded from the CCFA website for $€ 3$, which

[^1]:    In the context of the global slowdown observed in 2018 and 2019, French groups experienced a drop in their deliveries outside Europe ( $-30 \%$ between 2017 and 2019), while deliveries to Europe 17 countries outside France increased by $20 \%$ In two years. The integration of Lada into the Renault group on January 1, 2017, then of Jinbei and Huasong on January 1, 2018, and finally of Opel within the PSA group since August 1, 2017, also had a strong impact on the volumes of deliveries to these areas. Over the 2010-2019 period, deliveries increased overall, except in Asia (-770,000 units)

[^2]:    (1) On December 31.
    (2) 2018 data.
    (3) 2019 data.
    (4) The capital expenditure given for automotive activities are those for all industrial and commercial activities, excluding financing.
